Search for the Standard Model Higgs boson in the decay channel $H \rightarrow ZZ^{(*)} \rightarrow 4\ell$ with the ATLAS detector

The ATLAS Collaboration

Abstract

A search for the Standard Model Higgs boson in the decay channel $H \rightarrow ZZ^{(*)} \rightarrow \ell^+\ell^-\ell^+\ell^-$, where $\ell = e, \mu$, is presented. Proton-proton collision data at $\sqrt{s} = 7$ TeV recorded with the ATLAS detector and corresponding to an average integrated luminosity of 2.1 fb$^{-1}$ are compared to the Standard Model expectations. Upper limits on the production cross section of a Standard Model Higgs boson with a mass between 110 and 600 GeV are derived. The observed (expected) 95% confidence level upper limit on the production cross section for a Higgs boson with a mass of 194 GeV, the region with the best expected sensitivity for this search, is 0.99 (1.01) times the Standard Model prediction. The Standard Model Higgs boson is excluded at 95% confidence level in the mass ranges 191–197, 199–200 and 214–224 GeV.

Keywords: LHC, ATLAS, Higgs, leptons

1. Introduction

The search for the Standard Model (SM) Higgs boson $H$ is a major goal of the Large Hadron Collider (LHC) programme. Direct searches at the CERN LEP $e^+e^-$ collider led to a lower limit on the Higgs boson mass, $m_H$, of 114.4 GeV at 95% confidence level (CL). The searches at the Fermilab Tevatron $p\bar{p}$ collider have excluded at 95% CL the region 156 GeV $< m_H <$ 177 GeV. Results from the 2010 LHC run extended the search in the region 200 GeV $< m_H <$ 600 GeV by excluding a Higgs boson with cross section larger than $5 \times $ the SM prediction.

This letter presents a search for the SM Higgs boson in the mass range from 110 to 600 GeV in the channel $H \rightarrow ZZ^{(*)} \rightarrow \ell^+\ell^-\ell^+\ell^-$, where $\ell, \ell' = e, \mu$. Three distinct final states, $\mu\mu\mu\mu$ ($4\mu$), $ee\mu\mu$ ($2\ell 2\mu$), and $ee\ell\ell$ ($4e$), are selected. The largest background to this search comes from continuum $ZZ^{(*)}$ production. For $m_H <$ 180 GeV, contributions from $Z +$ jets and $t\bar{t}$ processes, where the additional charged leptons arise either from semi-leptonic decays of heavy flavour or from light flavour jets misidentified as leptons, are important. The $pp$ collision data were recorded with the ATLAS detector at the LHC at $\sqrt{s} = 7$ TeV and correspond to an average integrated luminosity of 2.1 fb$^{-1}$.

2. The ATLAS Detector

The ATLAS detector is a multi-purpose particle physics apparatus with forward-backward symmetric cylindrical geometry. The inner tracking detector (ID) consists of a silicon pixel detector, a silicon microstrip detector, and a transition radiation tracker. The ID is surrounded by a thin superconducting solenoid providing a 2 T magnetic field. A high-granularity lead-liquid argon (LAr) sampling calorimeter measures the energy and the position of electromagnetic showers. An iron-scintillator tile calorimeter provides hadronic coverage in the central rapidity range. The end-cap and forward rapidity regions are instrumented with LAr calorimetry for both electromagnetic and hadronic measurements. The muon spectrometer

1ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point. The z-axis is along the beam pipe, the x-axis points to the centre of the LHC ring and the y-axis points upward. Cylindrical coordinates $(r, \phi)$ are used in the transverse plane, $\phi$ being the azimuthal angle around the beam pipe. The pseudorapidity $\eta$ is defined as $\eta = -\ln [\tan (\theta/2)]$ where $\theta$ is the polar angle.
(MS) surrounds the calorimeters and consists of three large superconducting toroids, each with eight coils, a system of precision tracking chambers, and detectors for triggering. A three-level trigger system selects events to be recorded for offline analysis.

3. Data and Simulation Samples

The accumulated data are subjected to quality requirements ensuring that the relevant detector components were operating normally. The resulting average integrated luminosity of 2.1 fb$^{-1}$ corresponds to 2.28 fb$^{-1}$, 1.96 fb$^{-1}$ and 1.98 fb$^{-1}$ for the 4$\mu$, 2$e2\mu$ and 4$e$ final states, respectively.

The $H \to ZZ^{(*)} \to 4\ell$ signal is modelled using the POWHEG Monte Carlo (MC) event generator \cite{10,11}, which calculates separately the gluon and vector-boson fusion production mechanisms with matrix elements up to next-to-leading order (NLO). The Higgs boson transverse momentum, $p_T$, spectrum is reweighted to the calculation of Ref. \cite{12}, providing QCD corrections up to next-to-leading order and QCD soft-gluon resummations up to next-to-next-to-leading order (NNLL). POWHEG is interfaced to PYTHIA \cite{13} for showering and hadronization, which in turn is interfaced to PHOTOS \cite{14} for QED radiative corrections in the final state and to TAUOLA \cite{15,16} for the simulation of $\tau$ decays.

The cross sections for Higgs boson production, the corresponding branching fractions, as well as their uncertainties \cite{17}, are derived to next-to-next-to-leading order (NNLO) in QCD for the gluon fusion \cite{18,22} and vector boson fusion processes \cite{23}. In addition, QCD soft-gluon resummations up to NNLL are available for the gluon fusion process \cite{23}, while the NLO electroweak (EW) corrections are applied to both the gluon fusion \cite{26,27} and vector boson fusion processes \cite{28,29}. The Higgs boson decay branching ratio to the four-lepton final state is predicted by PROPHETIC-4F \cite{30,31}, which includes the complete NLO QCD+EW corrections, interference effects between identical final state fermions and leading two-loop heavy Higgs boson corrections to the four-fermion width. Table 1 gives the production cross sections for the $H \to 4\ell$ for several Higgs boson masses.

Table 1: Higgs boson production cross sections for both gluon and vector-boson fusion processes in pp collisions at $\sqrt{s} = 7$ TeV. The cross sections include the branching ratio of $H \to 4\ell$, with $\ell = e, \mu$. The errors are the total theoretical systematic uncertainty.

used, which includes both quark-antiquark annihilation at QCD NLO and gluon fusion. The inclusive $Z$ boson production, $Z +$ jets, is modelled using ALPGEN \cite{34} and is divided into $Z$ + light flavour jets and $Zb\bar{b}$; overlaps between the two samples are removed. Specifically, $bb$ pairs with separation $\Delta R = \sqrt{\Delta \phi^2 + \Delta \eta^2} \geq 0.4$ between the $b$-jets are taken from the matrix-element calculation, whereas for $\Delta R < 0.4$ the parton-shower jets are taken. PYTHIA is also used as a cross-check of the ALPGEN results. In this search the $Z +$ jets production is normalized from the data, but for comparisons the QCD NNLO EWZ \cite{35,36} and the MC@NLO \cite{32,33} cross section calculations are used for the inclusive $Z$ boson and the $Zb\bar{b}$ production, respectively. The $t\bar{t}$ background is modelled using MC@NLO \cite{37} and is normalized to the approximately NNLO cross section calculated using HATHOR \cite{38}. Both ALPGEN and MC@NLO are interfaced to HERWIG \cite{39} for parton shower hadronization and to JIMMY \cite{41} for the underlying event simulations.

All generated events undergo a full detector simulation performed using GEANT4 \cite{41,42}.

The number of $pp$ interactions in the same bunch crossing (pileup) is included in the simulation. The MC samples are reweighted to reproduce the observed distribution in the data.

4. Physics Object Identification and Event Selection

The data considered in this analysis were selected using single-lepton triggers. For electrons the threshold on the transverse energy, $E_T$, was
20 – 22 GeV depending on the LHC instantaneous luminosity and for muons the threshold on $p_T$ was 18 GeV. Both triggers are more than 99.5% efficient for events passing the offline selection described below.

Electron candidates consist of clusters of energy deposited in the electromagnetic calorimeter associated to ID tracks. The electrons must satisfy the “medium” electron criteria \(^{43}\), which require the shower profiles to be consistent with those expected for electromagnetic showers and a well reconstructed ID track pointing to the corresponding cluster. The electron transverse momentum is computed from the cluster energy and the track direction.

Muon candidates are reconstructed by matching ID tracks with either full or partial tracks in the MS \(^{43}\). For the former case, the two independent momentum measurements are combined, whereas for the latter case the momentum is measured using the ID information only, with the MS providing muon identification. To reject cosmic rays, tracks are required to be consistent with having originated from the primary vertex, defined as the reconstructed vertex with the highest $\sum p_T^2$ of associated tracks.

Leptons from Higgs boson decays are expected to be isolated and to originate from a common vertex. Track and calorimeter isolation as well as transverse impact parameter significance requirements are therefore applied to further reduce the $Z + \text{jets}$ and $t\bar{t}$ contributions. The sum of $p_T$ of tracks within $\Delta R < 0.2$ of the lepton divided by the lepton $p_T$ is required to be less than 0.15, while the sum $E_T$ of the calorimeter cells within $\Delta R < 0.2$ around the lepton divided by the lepton $p_T$ is required to be less than 0.3. In the case of electrons, the calorimeter cells corresponding to the electromagnetic shower are subtracted. The transverse impact parameter significance, defined as the transverse impact parameter of the lepton with respect to the primary vertex divided by its uncertainty, for the two lowest $p_T$ leptons of the quadruplet in events with $m_{4\ell} < 190$ GeV is required to be less than 3.5 and 6 for muons and electrons respectively. The selection efficiency of the isolation and impact parameter requirements has been studied using data both for isolated leptons, with $Z \rightarrow \ell\ell$ decays and non-isolated leptons from semi-leptonic $b$ and $c$–quark decays in a heavy-flavour enriched dijet sample. Good agreement is observed between data and simulation.

Higgs boson candidates are searched by selecting two same-flavour, opposite-sign isolated lepton pairs in an event. Each lepton must satisfy $p_T > 7$ GeV and be measured in the pseudorapidity range $|\eta| < 2.47$ for electrons and $|\eta| < 2.5$ for muons. The electron $p_T$ threshold is increased to 15 GeV in the transition region between the barrel and end-cap calorimeters ($1.37 < |\eta| < 1.52$). At least two leptons must have $p_T > 20$ GeV. The leptons are required to be well separated from each other with $\Delta R > 0.1$. The invariant mass of the lepton pair closest to the nominal $Z$ boson mass ($m_Z$) is denoted by $m_{12}$ and it is required that $|m_Z - m_{12}| < 15$ GeV. The invariant mass of the remaining lepton pair, $m_{34}$, is required to be lower than 115 GeV and greater than a threshold depending on the reconstructed four lepton mass, $m_{4\ell}$, as summarized in Table 2. The final discriminating variable is $m_{4\ell}$, where the Higgs boson production would appear as a clustering of events. The width of the reconstructed Higgs boson mass distribution is dominated by experimental resolution at low $m_H$ values, with a full-width at half-maximum (FWHM) which varies according to decay mode and is between 4.5 (4$\mu$) and 6.5 (4e) GeV for $m_H = 130$ GeV. At high $m_H$ the reconstructed width is dominated by the natural width of the Higgs boson with a FWHM of approximately 35 GeV at $m_H = 400$ GeV.

5. Background Estimation

The dominant $ZZ^{(*)}$ background is estimated using MC simulation. Generated events are required to pass the complete analysis selection and the final yield is normalized to the integrated luminosity.

The $t\bar{t}$ background is also estimated using MC simulation. Comparison of data to MC predictions, in a control sample of events with opposite sign electron-muon pairs consistent with the $Z$ boson mass and with one or two additional charged leptons, are used to verify that the $t\bar{t}$ background is small with respect to the dominant $ZZ^{(*)}$ process and in agreement with expectation.

The $Z + \text{jets}$ background is normalized using data. The control sample is formed by selecting events with a pair of same-flavour, opposite-sign isolated leptons consistent with the $Z$ boson mass, $|m_Z - m_{12}| < 15$ GeV, and a second same-flavour, opposite-sign lepton pair where only kinematic, but no isolation or impact parameter, requirements are applied. At this stage, the dominant background source depends on the flavour of the second lepton.
Table 2: Thresholds applied to $m_{4\ell}$ for reference values of $m_3$ (see text). For other $m_4$ values, the selection requirement is obtained via linear interpolation.

Figure 1: Invariant mass distributions (a) $m_{12}$, (b) $m_{34}$, and (c) $m_{4\ell}$ for the selected candidates. The data (dots) are compared to the background expectations from the dominant $ZZ^{(*)}$ process and the sum of $t\bar{t}$, $Zbb$ and $Z+$light flavour jets processes. Error bars represent 68.3% central confidence intervals.

pair: $Z+$light flavour jets dominates the final states with a second electron pair, while $Zbb$ production dominates the final states with a second muon pair after the contributions from $t\bar{t}$, $ZZ^{(*)}$, and muons from in-flight $\pi$ and $K$ decays which correspond to 44% of the event yield are subtracted. The observed background, which is found to be in good agreement with expectation, is extrapolated to the signal region by means of the MC simulation.
6. Systematic Uncertainties

Uncertainties on lepton reconstruction and identification efficiency, and on the momentum resolution and momentum scale are determined using samples of $W$, $Z$ and $J/\psi$ decays. The lepton efficiency uncertainty results in an acceptance uncertainty on the signal and the irreducible background which is uniform over the mass range of interest and amounts to 1.7% (1.2%) for the $4\mu$ (2$e$2$\mu$) channel. The uncertainty in the electron efficiency results in an acceptance uncertainty of 3% (2%) for the $4e$ (2$e$2$\mu$) channel at $m_{4\ell} = 600$ GeV reaching 15% (6%) at $m_{4\ell} = 110$ GeV.

A conservative theoretical uncertainty of 15% is assigned to the $ZZ^{(*)}$ background contribution [14]. The $Z$+light flavour jets and $Zb\bar{b}$ backgrounds are evaluated using data. A systematic uncertainty between 20% and 40% is assigned on their normalisation to account for the statistical uncertainty in the control sample and the MC-based extrapolation to the signal region. The uncertainty on the $tt$ cross section is found to be 10% by adding linearly the contributions from variations of the renormalization and factorization scales to those of the parton distribution functions.

The theoretical uncertainties on the Higgs boson production cross section are 15–20% for the gluon fusion process and 3–9% for the vector-boson fusion process [17], depending on the Higgs boson mass. They include uncertainties on the QCD scale and on the parton distribution functions [46–49]. An additional 2% uncertainty is added to the signal selection efficiency due to the modelling of the signal kinematics. This is evaluated by comparing signal samples generated with PYTHIA and the default POWHEG samples.

The overall uncertainty on the total integrated luminosity is 3.7% [8].

7. Results

The number of events observed in each final state, separately for $m_{4\ell} < 180$ GeV and $m_{4\ell} \geq 180$ GeV, are compared with the expectations for background and signal for various $m_H$ hypotheses in Table 3. In total 27 candidate events are selected by the analysis: 12 $4\mu$, 9 $2e2\mu$, and 6 $4e$ events, while in the same mass range 24 ± 4 events are expected from the background processes. The $m_{12}$, $m_{34}$, and $m_{4\ell}$ mass spectra are shown in Fig. 1. The $m_{4\ell}$ distribution for the total background and several signal hypotheses is compared to the data in Fig. 2. The selected events have been examined visually and no evidence for reconstruction problems was identified.

Upper limits are set on the Higgs boson cross section at 95% CL using the $C_L$ modified frequentist formalism [54] with the profile likelihood test statistic [51]. The test statistic is evaluated with a maximum likelihood fit of signal and background models to the observed $m_{4\ell}$ distribution. Figure 5 shows the expected and observed 95% CL cross section upper limits as a function of $m_H$ and Table 4 summarizes the numerical values for selected $m_H$ points. The consistency with the background-only hypothesis is quantified using the $p$-value, the probability that a background-only experiment fluctuates more than the observation. The most significant deviation from the background-only hypothesis is observed for $m_H = 242$ GeV with a $p$-value of 4.9%. These results do not account for the so-called “look-elsewhere” effect [52]. The SM Higgs boson is excluded at 95% CL in the mass ranges 191–197, 199–200 and 214–224 GeV.

---

The limits presented in this study for $m_H > 200$ GeV assume cross sections based on on-shell Higgs boson production and decay and use MC generators with an ad-hoc Breit-Wigner Higgs line shape. Recently potentially important effects related to off-shell Higgs boson production and interference effects between the Higgs boson signal and backgrounds have been discussed [13, 14]. The inclusion of such effects may affect limits at high Higgs masses ($m_H > 400$ GeV).
8. Summary

A search for the Standard Model Higgs boson in the decay channel $H \rightarrow ZZ^{(*)} \rightarrow 4\ell$ based on 2.1 fb$^{-1}$ of data recorded by the ATLAS detector at $\sqrt{s} = 7$ TeV during the 2011 run, has been presented. No significant excess of candidates is observed in the mass range between 110 and 600 GeV with respect to the expected SM background. The observed (expected) 95% CL upper limit on the Higgs boson production cross section, in units of the SM cross section, is 0.99 (1.01) for $m_H = 194$ GeV, the region with the best expected sensitivity for this search. The SM Higgs boson is excluded at 95% CL in the mass ranges 191 – 197, 199 – 200 and 214 – 224 GeV.

9. Acknowledgements

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

34 Niels Bohr Institute, University of Copenhagen, København, Denmark
35 (a) INFN Gruppo Collegato di Cosenza; (b) Dipartimento di Fisica, Università della Calabria, Arcavata di Rende, Italy
36 Faculty of Physics and Applied Computer Science, AGH-University of Science and Technology, Krakow, Poland
37 The Henryk Niewodniczanski Institute of Nuclear Physics, Polish Academy of Sciences, Krakow, Poland
38 DESY, Hamburg and Zeuthen, Germany
39 Physics Department, Southern Methodist University, Dallas TX, United States of America
40 Physics Department, University of Texas at Dallas, Richardson TX, United States of America
41 SUPA - School of Physics and Astronomy, University of Edinburgh, Edinburgh, United Kingdom
42 Fachhochschule Wiener Neustadt, Johannes Gutenbergstrasse 3 2700 Wiener Neustadt, Austria
43 INFN Laboratori Nazionali di Frascati, Frascati, Italy
44 Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg i.Br., Germany
45 SUPA - School of Physics and Cosmology, Harvard University, Cambridge MA, United States of America
46 Laboratoire de Physique Subatomique et de Cosmologie, Université Joseph Fourier and CNRS/IN2P3 and Institut National Polytechnique de Grenoble, Grenoble, France
47 Department of Physics, Hampton University, Hampton VA, United States of America
48 Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge MA, United States of America
49 II Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
50 (a) Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg; (b) Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg; (c) ZITI Institut für technische Informatik, Ruprecht-Karls-Universität Heidelberg, Mannheim, Germany
51 Faculty of Science, Hiroshima University, Hiroshima, Japan
52 Department of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
53 Department of Physics, Indiana University, Bloomington IN, United States of America
54 Institut für Astro- und Teilchenphysik, Leopold-Franzens-Universität, Innsbruck, Austria
55 University of Iowa, Iowa City IA, United States of America
56 Joint Institute for Nuclear Research, JINR Dubna, Dubna, Russia
57 KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
58 Graduate School of Science, Kobe University, Kobe, Japan
59 Faculty of Science, Kyoto University, Kyoto, Japan
60 Kyoto University of Education, Kyoto, Japan
61 Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata, Argentina
Department of Physics, Queen Mary University of London, London, United Kingdom
Department of Physics, Royal Holloway University of London, Surrey, United Kingdom
Department of Physics and Astronomy, University College London, London, United Kingdom
Laboratoire de Physique Nucléaire et de Hautes Energies, UPMC and Université Paris-Diderot and CNRS/IN2P3, Paris, France
Fysiska institutionen, Lunds universitet, Lund, Sweden
Departamento de Física Teorica C-15, Universidad Autonoma de Madrid, Madrid, Spain
Institut für Physik, Universität Mainz, Mainz, Germany
School of Physics and Astronomy, University of Manchester, Manchester, United Kingdom
CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
Department of Physics, University of Massachusetts, Amherst MA, United States of America
Department of Physics, McGill University, Montreal QC, Canada
School of Physics, University of Melbourne, Victoria, Australia
Department of Physics, The University of Michigan, Ann Arbor MI, United States of America
Department of Physics and Astronomy, Michigan State University, East Lansing MI, United States of America
INFN Sezione di Milano; Dipartimento di Fisica, Università di Milano, Milano, Italy
B.I. Stepanov Institute of Physics, National Academy of Sciences of Belarus, Minsk, Republic of Belarus
National Scientific and Educational Centre for Particle and High Energy Physics, Minsk, Republic of Belarus
Department of Physics, Massachusetts Institute of Technology, Cambridge MA, United States of America
Group of Particle Physics, University of Montreal, Montreal QC, Canada
P.N. Lebedev Institute of Physics, Academy of Sciences, Moscow, Russia
Institute for Theoretical and Experimental Physics (ITEP), Moscow, Russia
Moscow Engineering and Physics Institute (MEPhI), Moscow, Russia
Skobeltsyn Institute of Nuclear Physics, Lomonosov Moscow State University, Moscow, Russia
Fakultät für Physik, Ludwig-Maximilians-Universität München, München, Germany
Max-Planck-Institut für Physik (Werner-Heisenberg-Institut), München, Germany
Nagasaki Institute of Applied Science, Nagasaki, Japan
INFN Sezione di Napoli; Dipartimento di Scienze Fisiche, Università di Napoli, Napoli, Italy
Department of Physics and Astronomy, University of New Mexico, Albuquerque NM, United States of America
Department of Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands
Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam, Netherlands
Department of Physics, Northern Illinois University, DeKalb IL, United States of America
Budker Institute of Nuclear Physics (BINP), Novosibirsk, Russia
Department of Physics, New York University, New York NY, United States of America
Ohio State University, Columbus OH, United States of America
Faculty of Science, Okayama University, Okayama, Japan
Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK, United States of America
Department of Physics, Oklahoma State University, Stillwater OK, United States of America
Palacký University, RCPTM, Olomouc, Czech Republic
Center for High Energy Physics, University of Oregon, Eugene OR, United States of America
LAL, Univ. Paris-Sud and CNRS/IN2P3, Orsay, France
Graduate School of Science, Osaka University, Osaka, Japan
Department of Physics, University of Oslo, Oslo, Norway
Department of Physics, Oxford University, Oxford, United Kingdom
Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan

Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

Department of Physics, University of Toronto, Toronto ON, Canada

(a) TRIUMF, Vancouver BC; (b) Department of Physics and Astronomy, York University, Toronto ON, Canada

Institute of Pure and Applied Sciences, University of Tsukuba, Ibaraki, Japan

Science and Technology Center, Tufts University, Medford MA, United States of America

Centro de Investigaciones, Universidad Antonio Narino, Bogota, Colombia

Department of Physics and Astronomy, University of California Irvine, Irvine CA, United States of America

(a) INFN Gruppo Collegato di Udine; (b) ICTP, Trieste; (c) Dipartimento di Fisica, Università di Udine, Udine, Italy

Department of Physics, University of Illinois, Urbana IL, United States of America

Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden

Instituto de Física Corpuscular (IFIC) and Departamento de Física Atómica, Molecular y Nuclear and Departamento de Ingeniería Electrónica and Instituto de Microelectrónica de Barcelona (IMB-CNMI), University of Valencia and CSIC, Valencia, Spain

Department of Physics, University of British Columbia, Vancouver BC, Canada

Department of Physics and Astronomy, University of Victoria, Victoria BC, Canada

Waseda University, Tokyo, Japan

Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel

Department of Physics, University of Wisconsin, Madison WI, United States of America

Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany

Fachbereich C Physik, Bergische Universität Wuppertal, Wuppertal, Germany

Department of Physics, Yale University, New Haven CT, United States of America

Yerevan Physics Institute, Yerevan, Armenia

Domaine scientifique de la Doua, Centre de Calcul CNRS/IN2P3, Villeurbanne Cedex, France

a Also at Laboratorio de Instrumentacion e Fisica Experimental de Particulas - LIP, Lisboa, Portugal
b Also at Faculdade de Ciencias and CFNUL, Universidade de Lisboa, Lisboa, Portugal
c Also at Particle Physics Department, Rutherford Appleton Laboratory, Didcot, United Kingdom
d Also at CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
e Also at TRIUMF, Vancouver BC, Canada
f Also at Department of Physics, California State University, Fresno CA, United States of America
g Also at Faculty of Physics and Applied Computer Science, AGH-University of Science and Technology, Krakow, Poland
h Also at Fermilab, Batavia IL, United States of America
i Also at Department of Physics, University of Coimbra, Coimbra, Portugal
j Also at Università di Napoli Parthenope, Napoli, Italy
k Also at Institute of Particle Physics (IPP), Canada
l Also at Department of Physics, Middle East Technical University, Ankara, Turkey
m Also at Louisiana Tech University, Ruston LA, United States of America
n Also at Group of Particle Physics, University of Montreal, Montreal QC, Canada
o Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan
p Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg, Germany
q Also at Manhattan College, New York NY, United States of America
r Also at School of Physics and Engineering, Sun Yat-sen University, Guanzhou, China
s Also at Academia Sinica Grid Computing, Institute of Physics, Academia Sinica, Taipei, Taiwan
t Also at High Energy Physics Group, Shandong University, Shandong, China
u Also at Section de Physique, Université de Genève, Geneva, Switzerland
v Also at Departamento de Física, Universidade de Minho, Braga, Portugal
w Also at Department of Physics and Astronomy, University of South Carolina, Columbia SC, United States of America

21
Also at KFKI Research Institute for Particle and Nuclear Physics, Budapest, Hungary
Also at California Institute of Technology, Pasadena CA, United States of America
Also at Institute of Physics, Jagiellonian University, Krakow, Poland
Also at Department of Physics, Oxford University, Oxford, United Kingdom
Also at Institute of Physics, Academia Sinica, Taipei, Taiwan
Also at Department of Physics, The University of Michigan, Ann Arbor MI, United States of America
Also at DSM/IRFU (Institut de Recherches sur les Lois Fondamentales de l’Univers), CEA Saclay (Commissariat a l’Energie Atomique), Gif-sur-Yvette, France
Also at Laboratoire de Physique Nucléaire et de Hautes Energies, UPMC and Université Paris-Diderot and CNRS/IN2P3, Paris, France
Also at Department of Physics, Nanjing University, Jiangsu, China
