Search for Higgs and $Z$ Boson Decays to $J/\psi\gamma$ and $\Upsilon(nS)\gamma$
with the ATLAS Detector

The ATLAS Collaboration

Abstract

A search for the decays of the Higgs and $Z$ bosons to $J/\psi\gamma$ and $\Upsilon(nS)\gamma\ (n = 1, 2, 3)$ is performed
with $pp$ collision data samples corresponding to integrated luminosities of up to $20.3\ fb^{-1}$ collected at $\sqrt{s} = 8\ TeV$ with the ATLAS detector at the CERN Large Hadron Collider. No significant excess of
events is observed above expected backgrounds and 95% CL upper limits are placed on the branching
fractions. In the $J/\psi\gamma$ final state the limits are $1.5 \times 10^{-3}$ and $2.6 \times 10^{-6}$ for the Higgs and $Z$ boson
decays, respectively, while in the $\Upsilon(1S, 2S, 3S)\gamma$ final states the limits are $(1.3, 1.9, 1.3) \times 10^{-3}$ and
$(3.4, 6.5, 5.4) \times 10^{-6}$, respectively.
Search for Higgs and Z Boson Decays

to J/ψγ and Υ(nS)γ with the ATLAS Detector

G. Aad et al.

(ATLAS Collaboration)

(Dated: March 30, 2015)

A search for the decays of the Higgs and Z bosons to J/ψγ and Υ(nS)γ (n = 1, 2, 3) is performed with pp collision data samples corresponding to integrated luminosities of up to 20.3 fb⁻¹ collected at √s = 8 TeV with the ATLAS detector at the CERN Large Hadron Collider. No significant excess of events is observed above expected backgrounds and 95% CL upper limits are placed on the branching fractions. In the J/ψγ final state the limits are 1.5 × 10⁻³ and 2.6 × 10⁻⁶ for the Higgs and Z boson decays, respectively, while in the Υ(1S, 2S, 3S)γ final states the limits are (1.3, 1.9, 1.3) × 10⁻³ and (3.4, 6.5, 5.4) × 10⁻⁶, respectively.

Rare decays of the recently discovered Higgs boson [1 2] to a quarkonium state and a photon may offer unique sensitivity to both the magnitude and sign of the Yukawa couplings of the Higgs boson to quarks [3−6]. These couplings are challenging to access in hadron collisions through the direct H → q̅q decays, owing to the overwhelming QCD background [7].

Among the channels proposed as probes of the light quark Yukawa couplings [4 6], those with the heavy quarkonia J/ψ or Υ(nS) (n = 1, 2, 3), collectively denoted as Q, in the final state are the most readily accessible, without requirements for dedicated triggers and reconstruction methods beyond those used for identifying the J/ψ or Υ. In particular, the decay H → J/ψγ may represent a viable probe of the Hcc coupling [4], which is sensitive to physics beyond the Standard Model (SM) [8 9], at the Large Hadron Collider (LHC). The expected SM branching fractions for these decays have been calculated to be B(H → J/ψγ) = (2.8 ± 0.2) × 10⁻⁶, B[H → Υ(nS)γ] = (6.1 ± 1.4, 2.0 ± 1.3, 2.4 ± 1.3) × 10⁻¹⁰ [5]. No experimental information on these branching fractions exists. These decays are a source of background and potential control sample for the nonresonant decays H → µ⁺µ⁻γ. These nonresonant decays are sensitive to new physics [10].

Rare decay modes of the Z boson have attracted attention focused on establishing their sensitivity to new physics [11]. Several estimates of the SM branching fraction for the decay Z → J/ψγ are available [12 14] with the most recent being (9.96 ± 1.86) × 10⁻⁸ [14]. Measuring these Z → Qγ branching fractions, benefiting from the larger production cross section relative to the Higgs case, would provide an important benchmark for the search and eventual observation of H → Qγ decays. Additionally, experimental access to resonant Qγ decay modes would also provide an invaluable tool for the more challenging measurement of inclusive associated Qγ production, which has been suggested as a promising probe of the nature of quarkonium production in hadronic collisions [15 16].

The decays Z → Qγ have not yet been observed, with the only experimental information arising from inclusive measurements, such as B(Z → J/ψX) = (3.51 ± 0.23) × 10⁻³ and the 95% confidence level (CL) upper limits B[Z → Υ(nS)X] < (4.4, 13.9, 9.4) × 10⁻⁵, from LEP experiments [17 21].

This Letter presents a search for decays of the recently observed Higgs boson and the Z boson to J/ψγ and Υ(nS)γ final states. The decays J/ψ → µ⁺µ⁻ and Υ(nS) → µ⁺µ⁻ are used to reconstruct the quarkonium states. The search is performed with a sample of pp collision data corresponding to an integrated luminosity of 19.2 fb⁻¹ (20.3 fb⁻¹) for the J/ψγ [Υ(nS)γ] analysis respectively, recorded at a center-of-mass energy √s = 8 TeV with the ATLAS detector [22], described in detail in Ref. [23].

Higgs boson production is modeled using the POWHEG-BOX Monte Carlo (MC) event generator [24 28], separately for the gluon fusion (ggF) and vector-boson fusion (VBF) processes calculated in Quantum Chromodynamics (QCD) up to next-to-leading order in αS. The Higgs boson transverse momentum (pt) distribution predicted for the ggF process is reweighted to match the calculations of Refs [29 30], which include QCD corrections up to next-to-next-to-leading order and QCD soft-gluon resummations up to next-to-next-to-leading logarithms. Quark mass effects in ggF production [31] are also accounted for.

Physics beyond the SM that modifies the charm coupling can also change production dynamics and branching fractions. In this analysis we assume the production rates and dynamics for a SM Higgs boson with mH = 125 GeV, obtained from Ref. [32], with an uncertainty on the dominant ggF production mode of 12%. The VBF signal model is appropriately scaled to account for the production of a Higgs boson in association with a W or Z boson or in association with a tt pair, correcting for the relative production rates and experimental acceptances for these channels. Contributions from nonresonant H → (Z* / γ*)γ → μ⁺μ⁻γ decays are expected to be
negligible with respect to the present sensitivity \[33,35\].

The POWHEG-BOX MC event generator is also used to model Z boson production. The total cross section is estimated from Ref. \[36\], with an uncertainty of 4%.

The Higgs and Z boson decays are simulated as a cascade of two-body decays. Effects of the helicity of the quarkonium states on the dimuon kinematics are accounted for in both cases. For Higgs and Z boson events generated using POWHEG-BOX, PYTHIA8.1 \[37,38\] is used to simulate showering and hadronization while PHOTOS \[39,40\] is used to provide QED radiative corrections to the final state. The simulated events are passed through the full GEANT4 simulation of the ATLAS detector \[41,42\] and processed with the same software used to reconstruct data events.

The data used to perform the search in the $J/\psi \gamma$ channel were collected using a trigger that required at least one muon with $p_T > 18$ GeV. The events used in the $\Upsilon(nS) \gamma$ channel were collected with a trigger requiring an isolation muon with $p_T > 24$ GeV and a dimuon trigger with $p_T$ thresholds of 18 and 8 GeV for each of the muons, respectively. Events are retained for analysis if they were collected under stable LHC beam conditions and the detector components were operating normally.

Muons are reconstructed from inner-detector tracks combined with independent muon spectrometer tracks or track segments \[43\] and are required to have $p_T > 3$ GeV and pseudorapidity $|\eta| < 2.5$. Candidate $Q \rightarrow \mu^+\mu^-$ decays are reconstructed from pairs of oppositely charged muons consistent with originating from a common vertex. The highest-$p_T$ muon in a pair, called the leading muon in the following, is required to have $p_T > 20$ GeV. Dimuons with a mass, $m_{\mu\mu}$, within 0.2 GeV of the $J/\psi$ mass \[17\] are identified as $J/\psi \rightarrow \mu^+\mu^-$ candidates. In case both muons in the pair are within $|\eta| < 1.05$, the said requirement is tightened to 0.15 GeV. Dimuons with $8.0 < m_{\mu\mu} < 12.0$ GeV are considered as $\Upsilon(nS) \rightarrow \mu^+\mu^-$ candidates. The transverse momentum of each $Q \rightarrow \mu^+\mu^-$ candidate, $p_T^{\mu\mu}$, is required to exceed 36 GeV.

Selected $Q \rightarrow \mu^+\mu^-$ candidates are subjected to vertex and vertex quality requirements. The sum of the $p_T$ of the reconstructed inner-detector tracks and calorimeter energy deposits within $\Delta R = \sqrt{(\Delta \phi)^2 + (\Delta \eta)^2} = 0.2$ of the leading muon is required to be less than 10% of the muon’s $p_T$. The transverse momentum of the inner-detector track associated with the leading muon is subtracted from the sum and the subleading muon is also subtracted if it falls within the isolation cone. To reject backgrounds from $b$-hadron decays, the measured transverse decay length $L_{xy}$ between the dimuon vertex and the primary $pp$ vertex is required to be less than three times its uncertainty $\sigma_{L_{xy}}$. In this case, the primary $pp$ vertex is defined as the reconstructed vertex with the highest $\sum_i p_T^2$ of all associated tracks used to form the vertex.

Photon reconstruction is seeded by clusters of energy in the electromagnetic calorimeter. Clusters without matching tracks are classified as unconverted photon candidates. Clusters matched to tracks consistent with the hypothesis of a photon conversion into an $e^+e^-$ pair are classified as converted photon candidates \[14\]. Reconstructed photon candidates are required to have transverse momentum $p_T^\gamma > 36$ GeV, pseudorapidity $|\eta^\gamma| < 2.37$, excluding the barrel/endcap calorimeter transition region $1.37 < |\eta^\gamma| < 1.52$, and to satisfy the “tight” photon identification criteria \[15\]. To further suppress the contamination from jets, an isolation requirement is imposed. The sum of the transverse momentum of all tracks and calorimeter energy deposits within $\Delta R = 0.2$ of the photon direction, excluding those associated with the reconstructed photon, is required to be less than 8% of the photon’s transverse momentum.

Combinations of a $Q \rightarrow \mu^+\mu^-$ candidate and a photon, satisfying $\Delta \phi(\mu^+\mu^-,\gamma) > 0.5$, are retained for further analysis. To improve the sensitivity of the search, the events are classified into four exclusive categories, based upon the pseudorapidity of the muons and the photon reconstruction classification. Events where both muons are within the region $|\eta| < 1.05$ and the photon is (is not) classified as a conversion constitute the “barrel converted” BC (“barrel unconverted” BU) category. Events where at least one of the muons is outside the region $|\eta| < 1.05$ and the photon is (is not) classified as a conversion constitute the “endcap converted” EC (“endcap unconverted” EU) category. The number of candidates observed in each category following the complete event selection is shown in Table \ref{tab:results}.

The total signal efficiency (kinematic acceptance, trigger and reconstruction efficiencies) in the $J/\psi \gamma$ final state is 22% and 12% for the Higgs and Z boson decays, respectively. The corresponding efficiencies for the $\Upsilon(nS) \gamma$ final state are 28% and 15%. The $m_{\mu\mu\gamma}$ resolution is similar for both the Higgs and Z boson decays and varies between 1.2% and 1.8%. The $m_{\mu\mu}$ resolution is 1.4% and 2.4% for the barrel and endcap categories, respectively.

The main source of background, referred to as inclusive QCD background, is dominated by inclusive quarkonium production where a jet in the event is reconstructed as a photon. For the $\Upsilon(nS) \gamma$ final state, events containing $Z \rightarrow \mu^+\mu^-$ decays with final-state photon radiation (FSR) constitute a second source of background, a contribution which is found to be negligible in the $J/\psi \gamma$ final state. The normalization of both of these background sources is extracted directly from a fit to data. The modeling of the inclusive QCD background shape, obtained with a data-driven approach, and of the $Z \rightarrow \mu^+\mu^-$ background shape, obtained from simulation, is described in the following two paragraphs.

The background from inclusive QCD processes is modeled with a nonparametric data-driven approach using templates to describe the kinematic distributions. The
approach exploits a sample of loosely selected $\mu^+\mu^-\gamma$ events, around 2400 in the $J/\psi\gamma$ channel and around 3200 in the $\Upsilon(nS)\gamma$ channel. These control samples are formed from events satisfying the nominal $Q\gamma$ selection, but with relaxed dimuon and photon transverse momenta ($p_T^\mu > 25$ GeV and $p_T^\gamma > 25$ GeV) and isolation requirements (separate fractional calorimeter energy and track momentum isolation for the photon and dimuon system of less than 60%). Contamination of this sample from signal events is expected to be negligible. Probability density functions (pdfs) used to model the $p_T^{\mu\mu}$, $p_T^\gamma$, $\Delta\eta(\mu^+\mu^-\gamma)$, and $\Delta\phi(\mu^+\mu^-\gamma)$ distributions of this control sample, independently for each category, are constructed using Gaussian kernel density estimation [40]. To account for kinematic correlations, the distributions of $p_T^\gamma$, $\Delta\eta(\mu^+\mu^-\gamma)$, and $\Delta\phi(\mu^+\mu^-\gamma)$ are estimated in eight exclusive regions of $p_T^{\mu\mu}$. In the case of the dimuon and photon isolation variables, correlations are accounted for by using two-dimensional histograms derived in five exclusive regions of $p_T^{\mu\mu}$. The $m_{\mu\mu}$ distributions are modeled using Gaussian pdfs, with parameters derived from a fit to the control sample. In the $\Upsilon(nS)\gamma$ channel, the data control sample is corrected for contamination from $Z \rightarrow \mu^+\mu^-\gamma$ decays. The pdfs of these kinematic and isolation variables are sampled to generate an ensemble of pseudocandidates, each with a complete $Q\gamma$ four-vector and an associated pair of correlated dimuon and photon isolation values. The nominal selection requirements are imposed on the ensemble and the surviving pseudocandidates are used to construct templates for the kinematic distributions, notably the inclusive QCD background $m_{\mu\mu}\gamma$ and $p_T^{\mu\mu}$ distributions.

The background from $Z \rightarrow \mu^+\mu^-\gamma$ decays is modeled with templates derived from a sample of simulated $Z$ boson events with $m_{\mu\mu}$ in the $\Upsilon(nS)$ mass range. To validate this background model with data, the sidebands of the $m_{\mu\mu}\gamma$ distribution in several validation regions, defined by relaxed kinematic or isolation requirements, are used to compare the prediction of the background model with the data. Good agreement within the statistical uncertainties is observed.

The composition of the inclusive QCD background and the $Z \rightarrow \mu^+\mu^-\gamma$ decay contribution is investigated with data. The details of the composition do not enter directly the background estimation for this search, but the composition itself is a crucial input in feasibility studies for future searches or measurements, where projections of these backgrounds to different center-of-mass energies or luminosity conditions are needed. To facilitate this study, the selection requirements on $m_{\mu\mu}$ and $|L_{xy}/\sigma_{L_{xy}}|$ are relaxed to include the sideband regions. In the $J/\psi\gamma$ final state, a simultaneous unbinned maximum likelihood fit to the $m_{\mu\mu}$ and $|L_{xy}/\sigma_{L_{xy}}|$ distributions is performed. Once the simultaneous fit is performed, the composition of the subset of events satisfying the nominal $m_{\mu\mu}$ and $|L_{xy}/\sigma_{L_{xy}}|$ requirements is estimated. After the complete event selection, around 56% of the events originate from prompt $J/\psi$ production, 3% from non-prompt $J/\psi$ production (from $b$-hadron decays) and 41% are combinatoric backgrounds from nonresonant dimuon events.

A separate simultaneous fit to the $m_{\mu\mu}\gamma$ and $m_{\mu\mu}$ distributions of the same sample of candidate $J/\psi$ events finds no significant contribution from $Z \rightarrow \mu^+\mu^-\gamma$ decays, a conclusion that is also supported by a study based on simulated $Z \rightarrow \mu^+\mu^-\gamma$ events.

For the $\Upsilon(nS)\gamma$ final state a simultaneous fit is performed to the $m_{\mu\mu}\gamma$ and $m_{\mu\mu}$ distributions. After the full event selection, inclusive $\Upsilon(nS)$ production accounts for 7% of the events, 27% of the events are produced in $Z \rightarrow \mu^+\mu^-\gamma$ decays, and 66% of the events are associated with combinatoric backgrounds from nonresonant dimuon events. The contribution from $Z \rightarrow \mu^+\mu^-\gamma$ decays is in agreement with the MC expectation.

Trigger efficiencies and efficiencies for muon and photon identification are determined from samples of $Z \rightarrow \ell\ell$, $Z \rightarrow \ell\ell\gamma$ ($\ell = e, \mu$) and $J/\psi \rightarrow \mu^+\mu^-$ decays in data [43, 47]. The systematic uncertainty on the expected signal yield associated with the trigger efficiency is estimated to be 1.7%. The photon (both converted and unconverted) and muon reconstruction and identification efficiency uncertainties are estimated to be 0.5% (0.7%) and 0.4% (0.4%) for the Higgs boson ($Z$ boson) signal, respectively. An uncertainty on the integrated luminosity of 2.8% is derived using the method described in Ref. [43]. The photon energy scale uncertainty, determined from $Z \rightarrow e^+e^-$ and validated using $Z \rightarrow \ell\ell\gamma$ decays [49], is propagated through the simulated signal samples as a function of $\eta^\gamma$ and $p_T^\gamma$. The uncertainty associated with the description of the photon energy scale in the simulation is found to be less than 0.2% of the three-body...
invariant mass while the uncertainty associated with the photon energy resolution is found to be negligible relative to the overall three-body invariant mass resolution. Similarly, the systematic uncertainty associated with the muon momentum measurement is determined using data samples of \( J/\psi \rightarrow \mu^+\mu^- \) and \( Z \rightarrow \mu^+\mu^- \) decays and validated using \( \Upsilon(nS) \rightarrow \mu^+\mu^- \) decays [43]. For the \( p_T \) range relevant to this analysis, the systematic uncertainties associated with the muon momentum scale are negligible.

The uncertainty in the shape of the inclusive QCD background is estimated through the study of variations in the background modeling procedure. The shape of the pdf is allowed to vary around the nominal shape within an envelope associated with shifts in the \( p_T^{\mu\mu} \) and \( \phi \) distributions. Furthermore, a separate background model, generated without removing the contamination from \( Z \rightarrow \mu^+\mu^-\gamma \) decays, provides an upper bound on potential mismodeling associated with this process.

Results are extracted by means of a simultaneous unbinned maximum likelihood fit, performed to the selected events with \( 30 \text{ GeV} < m_{\mu\mu\gamma} < 230 \text{ GeV} \) separately in each of the analysis categories. In the \( J/\psi\gamma \) final state, the fit is performed on the \( m_{\mu\mu\gamma} \) and \( p_T^{\mu\mu\gamma} \) distributions, while for the \( \Upsilon(nS) \) \( \gamma \) candidates a similar fit is performed using the \( m_{\mu\mu\gamma} \), \( p_T^{\mu\mu\gamma} \), and \( m_{\mu\mu} \) distributions. The latter distribution provides discrimination between the three \( \Upsilon(nS) \) states and constrains the \( Z \rightarrow \mu^+\mu^-\gamma \) background normalization. No significant \( Z \rightarrow Q\gamma \) or \( H \rightarrow Q\gamma \) signals are observed, as shown in Figs. 1 and 2.

\end{figure}
Upper limits on the branching fractions for the Higgs and Z boson decays to $J/\psi \gamma$ and $\Upsilon(nS) \gamma$ are set using the CLs modified frequentist formalism [50] with the profile likelihood ratio test statistic [51]. The expected SM production cross sections are assumed for the Higgs and Z bosons. The results are summarized in Table II.

The 95% CL upper limit on the branching fraction for $H \rightarrow J/\psi \gamma$ decays corresponds to about 540 times the expected SM branching fraction. The upper limits on the $Z \rightarrow J/\psi \gamma$ and $Z \rightarrow \Upsilon(nS) \gamma$ branching fractions significantly constrain the allowed range of values obtained from theoretical calculations [12–14]. Upper limits are also set on the combined $\mathcal{B}[H \rightarrow \Upsilon(nS)\gamma] < 2.0 \times 10^{-3}$ and $\mathcal{B}[Z \rightarrow \Upsilon(nS)\gamma] < 7.9 \times 10^{-6}$, where the relative contribution of each final state to the potential signal is profiled (allowed to float to the values that maximize the likelihood) during the fit.

In conclusion, the first search for the decays of the SM Higgs and Z bosons to $J/\psi \gamma$ and $\Upsilon(nS) \gamma$ ($n = 1, 2, 3$) has been performed with $\sqrt{s} = 8$ TeV $pp$ collision data samples corresponding to integrated luminosities of up to 20.3 fb$^{-1}$ collected with the ATLAS detector at the LHC. No significant excess of events is observed above the background. In the $J/\psi \gamma$ final state the 95% CL upper limits on the relevant branching fractions for the SM Higgs and Z bosons are $1.5 \times 10^{-3}$ and $2.6 \times 10^{-6}$, respectively. The corresponding upper limits in the $\Upsilon(1S, 2S, 3S) \gamma$ channels are $(1.3, 1.9, 1.3) \times 10^{-3}$ and $(3.4, 6.5, 5.4) \times 10^{-6}$, for the SM Higgs and Z bosons respectively. These are the first experimental bounds on exclusive Higgs and Z boson decays to final states involving quarkonia.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN and the ATLAS Tier-1 facilities at TRIUMF (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), ASGC (Taiwan), RAL (UK) and BNL (USA) and in the Tier-2 facilities worldwide.

et al.

[4] ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) in the center of the detector and the z-axis along the beam pipe. The x-axis points from the IP to the center of the LHC ring, and the y-axis points upward. Cylindrical coordinates (r, φ) are used in the transverse plane, φ being the azimuthal angle around the beam pipe. The pseudorapidity is defined in terms of the polar angle θ as \( \eta = -\ln \tan(\theta/2) \).

45 Department of Physics, Duke University, Durham NC, United States of America
46 SUPA - School of Physics and Astronomy, University of Edinburgh, Edinburgh, United Kingdom
47 INFN Laboratori Nazionali di Frascati, Frascati, Italy
48 Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg, Germany
49 Section de Physique, Université de Genève, Geneva, Switzerland
50 (a) INFN Sezione di Genova; (b) Dipartimento di Fisica, Università di Genova, Genova, Italy
51 (a) E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi; (b) High Energy Physics Institute, Tbilisi State University, Tbilisi, Georgia
52 II Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
53 SUPA - School of Physics and Astronomy, University of Glasgow, Glasgow, United Kingdom
54 II Physikalisches Institut, Georg-August-Universität, Göttingen, Germany
55 Laboratoire de Physique Subatomique et de Cosmologie, Université Grenoble-Alpes, CNRS/IN2P3, Grenoble, France
56 Department of Physics, Hampton University, Hampton VA, United States of America
57 Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge MA, United States of America
58 (a) Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg; (b) Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg; (c) ZITI Institut für technische Informatik, Ruprecht-Karls-Universität Heidelberg, Mannheim, Germany
59 Faculty of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
60 (a) Department of Physics, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong; (b) Department of Physics, The University of Hong Kong, Hong Kong; (c) Department of Physics, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China
61 Department of Physics, Indiana University, Bloomington IN, United States of America
62 Institut für Astro- und Teilchenphysik, Leopold-Franzens-Universität, Innsbruck, Austria
63 University of Iowa, Iowa City IA, United States of America
64 Department of Physics and Astronomy, Iowa State University, Ames IA, United States of America
65 Joint Institute for Nuclear Research, JINR Dubna, Dubna, Russia
66 KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
67 Graduate School of Science, Kobe University, Kobe, Japan
68 Faculty of Science, Kyoto University, Kyoto, Japan
Department of Physics, University of Pennsylvania, Philadelphia PA, United States of America

Petersburg Nuclear Physics Institute, Gatchina, Russia

(a) INFN Sezione di Pisa; (b) Dipartimento di Fisica E. Fermi, Università di Pisa, Pisa, Italy

Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA, United States of America

(a) Laboratorio di Instrumentazione e Fisica Experimental de Particulas - LIP, Lisboa; (b) Faculdade de Ciências, Universidade de Lisboa, Lisboa; (c) Department of Physics, University of Coimbra, Coimbra; (d) Centro de Física Nuclear da Universidade de Lisboa, Lisboa; (e) Departamento de Fisica, Universidade do Minho, Braga; (f) Departamento de Física Teorica y del Cosmos and CAFPE, Universidad de Granada, Granada (Spain); (g) Dep. Fisica and CEFITEC of Faculdade de Ciencias e Tecnologia, Universidade Nova de Lisboa, Caparica, Portugal

Institute of Physics, Academy of Sciences of the Czech Republic, Praha, Czech Republic

Czech Technical University in Prague, Praha, Czech Republic

Faculty of Mathematics and Physics, Charles University in Prague, Praha, Czech Republic

State Research Center Institute for High Energy Physics, Protvino, Russia

Particle Physics Department, Rutherford Appleton Laboratory, Didcot, United Kingdom

Ritsumeikan University, Kusatsu, Shiga, Japan

(a) INFN Sezione di Roma; (b) Dipartimento di Fisica, Sapienza Università di Roma, Roma, Italy

(a) INFN Sezione di Roma Tor Vergata; (b) Dipartimento di Fisica, Università di Roma Tor Vergata, Roma, Italy

(a) INFN Sezione di Roma Tre; (b) Dipartimento di Matematica e Fisica, Università Roma Tre, Roma, Italy

(a) Faculté des Sciences Ain Chock, Réseau Universitaire de Physique des Hautes Energies - Université Hassan II, Casablanca; (b) Centre National de l’Energie des Sciences Techniques Nucléaires, Rabat; (c) Faculté des Sciences Semlalia, Université Cadi Ayyad, LPHEA-Marrakech; (d) Faculté des Sciences, Université Mohamed Premier and LPTPM, Oujda; (e) Faculté des sciences, Université Mohammed V-Agdal, Rabat, Morocco

DSM/IRFU (Institut de Recherches sur les Lois Fondamentales de l’Univers), CEA Saclay (Commissariat à l’Energie Atomique et aux Energies Alternatives), Gif-sur-Yvette, France

Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA, United States of America

Department of Physics, University of Washington, Seattle WA, United States of America

Department of Physics and Astronomy, University of Sheffield, Sheffield, United Kingdom

Department of Physics, Shinshu University, Nagano, Japan

Fachbereich Physik, Universität Siegen, Siegen, Germany

Department of Physics, Simon Fraser University, Burnaby BC, Canada

SLAC National Accelerator Laboratory, Stanford CA, United States of America

(a) Faculty of Mathematics, Physics & Informatics, Comenius University, Bratislava; (b) Department of Subnuclear Physics, Institute of Experimental Physics of the Slovak Academy of Sciences, Kosice, Slovak Republic

(a) Department of Physics, University of Cape Town, Cape Town; (b) Department of Physics, University of Johannesburg, Johannesburg; (c) School of Physics, University of the Witwatersrand, Johannesburg, South Africa

(a) Department of Physics, Stockholm University; (b) The Oskar Klein Centre, Stockholm, Sweden

Physics Department, Royal Institute of Technology, Stockholm, Sweden

Departments of Physics & Astronomy and Chemistry, Stony Brook University, Stony Brook NY, United States of America

Department of Physics and Astronomy, University of Sussex, Brighton, United Kingdom

School of Physics, University of Sydney, Sydney, Australia

Institute of Physics, Academia Sinica, Taipei, Taiwan

Department of Physics, Technion: Israel Institute of Technology, Haifa, Israel

Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv, Israel

Department of Physics, Aristotle University of Thessaloniki, Thessaloniki, Greece

International Center for Elementary Particle Physics and Department of Physics, The University of Tokyo, Tokyo, Japan

Graduate School of Science and Technology, Tokyo Metropolitan University, Tokyo, Japan

Department of Physics, Tokyo Institute of Technology, Tokyo, Japan

Department of Physics, University of Toronto, Toronto ON, Canada

(a) TRIUMF, Vancouver BC; (b) Department of Physics and Astronomy, York University, Toronto ON, Canada

Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba, Japan

Department of Physics and Astronomy, Tufts University, Medford MA, United States of America

Centro de Investigaciones, Universidad Antonio Narino, Bogota, Colombia

Department of Physics and Astronomy, University of California Irvine, Irvine CA, United States of America
165 (a) INFN Gruppo Collegato di Udine, Sezione di Trieste, Udine; (b) ICTP, Trieste; (c) Dipartimento di Chimica, Fisica e Ambiente, Università di Udine, Udine, Italy
166 Department of Physics, University of Illinois, Urbana IL, United States of America
167 Department of Physics and Astronomy, University of Uppsala, Uppsala, Sweden
168 Instituto de Física Corpuscular (IFIC) and Departamento de Física Atómica, Molecular y Nuclear and Departamento de Ingeniería Electrónica and Instituto de Microelectrónica de Barcelona (IMB-CNM), University of Valencia and CSIC, Valencia, Spain
169 Department of Physics, University of British Columbia, Vancouver BC, Canada
170 Department of Physics and Astronomy, University of Victoria, Victoria BC, Canada
171 Department of Physics, University of Warwick, Coventry, United Kingdom
172 Waseda University, Tokyo, Japan
173 Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel
174 Department of Physics, University of Wisconsin, Madison WI, United States of America
175 Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany
176 Fachbereich C Physik, Bergische Universität Wuppertal, Wuppertal, Germany
177 Department of Physics, Yale University, New Haven CT, United States of America
178 Yerevan Physics Institute, Yerevan, Armenia
179 Centre de Calcul de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France

[a] Also at Department of Physics, King’s College London, London, United Kingdom
[b] Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan
[c] Also at Novosibirsk State University, Novosibirsk, Russia
[d] Also at TRIUMF, Vancouver BC, Canada
[e] Also at Department of Physics, California State University, Fresno CA, United States of America
[f] Also at Department of Physics, University of Fribourg, Fribourg, Switzerland
[g] Also at Tomsk State University, Tomsk, Russia
[h] Also at CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France
[i] Also at Università di Napoli Parthenope, Napoli, Italy
[j] Also at Institute of Particle Physics (IPP), Canada
[k] Also at Particle Physics Department, Rutherford Appleton Laboratory, Didcot, United Kingdom
[l] Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg, Russia
[m] Also at Louisiana Tech University, Ruston LA, United States of America
[n] Also at Institucio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona, Spain
[o] Also at Department of Physics, National Tsing Hua University, Taiwan
[p] Also at Department of Physics, The University of Texas at Austin, Austin TX, United States of America
[q] Also at Institute of Theoretical Physics, Ilia State University, Tbilisi, Georgia
[r] Also at CERN, Geneva, Switzerland
[s] Also at Georgian Technical University (GTU), Tbilisi, Georgia
[t] Also at Ochadai Academic Production, Ochanomizu University, Tokyo, Japan
[u] Also at Manhattan College, New York NY, United States of America
[v] Also at Institute of Physics, Academia Sinica, Taipei, Taiwan
[w] Also at LAL, Université Paris-Sud and CNRS/IN2P3, Orsay, France
[x] Also at Academia Sinica Grid Computing, Institute of Physics, Academia Sinica, Taipei, Taiwan
[y] Also at Laboratoire de Physique Nucléaire et de Hautes Energies, UPMC and Université Paris-Diderot and CNRS/IN2P3, Paris, France

[z] Also at Dipartimento di Fisica, Sapienza Università di Roma, Roma, Italy
[za] Also at Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia
[zb] Also at Section de Physique, Université de Genève, Geneva, Switzerland
[zc] Also at International School for Advanced Studies (SISSA), Trieste, Italy
[zd] Also at Department of Physics and Astronomy, University of South Carolina, Columbia SC, United States of America
[ze] Also at School of Physics and Engineering, Sun Yat-sen University, Guangzhou, China
[zf] Also at Faculty of Physics, M.V.Lomonosov Moscow State University, Moscow, Russia
[zg] Also at National Research Nuclear University MEPhI, Moscow, Russia
[zh] Also at Department of Physics, Stanford University, Stanford CA, United States of America
[zi] Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest, Hungary
aj Also at Department of Physics, Oxford University, Oxford, United Kingdom
ak Also at Department of Physics, The University of Michigan, Ann Arbor MI, United States of America
al Also at Discipline of Physics, University of KwaZulu-Natal, Durban, South Africa
am Also at University of Malaya, Department of Physics, Kuala Lumpur, Malaysia
