Report No. 9932 (July 1999)
Finite rank modules over a valuation ring

W.H. Schikhof

W.H. SCHIKHOF Department of Mathematics, University of Nijmegen, Toernooiiveld 6525 ED Nijmegen, The Netherlands

Abstract

Let $K = (K, |·|)$ be a spherically (= maximally) complete non-archimedean rank 1 valued field with valuation ring $B_K := \{ \lambda \in K : |\lambda| \leq 1 \}$. It is proved (Theorem 3.8) that a $B_K$-module of finite rank is a direct sum of $B_K$-modules of rank 1. The proof uses convexity techniques and seminorms. However to obtain the announced result it is not sufficient to use only real-valued seminorms, (see §2), so we are led to allow a more general range, a so-called $G$-module (see §3).

Introduction

Let $K$, $B_K$ be as above. A subset $A$ of a $K$-vector space $E$ is called absolutely convex if $0 \in A$ and if $x, y \in A$, $\lambda, \mu \in B_K$ implies $\lambda x + \mu y \in A$ i.e. if $A$ is a $B_K$-submodule of $E$. A $B_K$-module $B$ is said to be of finite rank if there is an $n \in \mathbb{N}$, an absolutely convex $A \subset K^n$ and a surjective $B_K$-module homomorphism $A \to B$. The smallest $n$ for which this is true is called the rank of $B$. (One can prove easily that it is the same as the Fleischer rank introduced in [1].) The following natural question was stated in [2], p. 35 as an open problem.

Q. Is every rank $n$ $B_K$-module a direct sum of $n$ rank 1 submodules?

For a non-spherically complete base field, a twodimensional indecomposable absolutely convex set is constructed in [3], p. 68 so the condition of spherical completeness of $K$ is necessary to obtain a positive answer.

In this note we prove that Q has a positive answer. During preparation of this note, it was kindly pointed out by Prof. L. Fuchs that there is a direct purely algebraic proof using the theory of [1], sketched as follows. Let $B$ be a finite rank $B_K$-module. It is a surjective image of a finite rank torsion-free module $A$. As every rank one submodule of $A$ is pure-injective, $A$ is completely decomposable. By [1], Th. 5.5, $B$ is polyserial, by spherical completeness and [1], Th. 5.1 all uniserials are pure-injective and therefore $A$ is a direct sum of uniserials.

Now we present an alternative proof, using techniques of convexity and seminorms. To this end we write a $B_K$-module of rank $n$ as $T/S$ where $S \subset T$ are absolutely convex sets in $K^n$ and study orthogonality properties of the Minkowski seminorms of
S and T. As we will see in §2 this method yields the result only for special, so-called edged sets, S and T. To obtain the full answer we extend the notion of Minkowski function by admitting a range set different from \([0, \infty)\), see §3.

1 Preliminaries

Throughout \(K, B_K\) are as above. For a subset \(X\) of a \(K\)-vector space \(E\) we denote by \([X]\) the \(K\)-linear span of \(X\). An absolutely convex set \(A \subset E\) is called absorbing if \([A] = E\).

Let \(p\) be a (non-archimedean) seminorm on a \(K\)-vector space \(E\). Two subspaces \(D_1, D_2\) of \(E\) are called p-orthogonal if \(D_1 \cap D_2 = \{0\}\) and \(p(d_1 + d_2) = \max\{p(d_1), p(d_2)\}\) for all \(d_1 \in D_1, d_2 \in D_2\). If, in addition, \(E = D_1 \oplus D_2\) we call \(D_2 (D_1)\) a p-orthocomplement of \(D_1 (D_2)\).

A finite linearly independent sequence \(e_1, \ldots, e_n\) in \(E\) is called p-orthogonal if \(p(\sum_{i=1}^{n} \lambda_i e_i) = \max_{1 \leq i \leq n} p(\lambda_i e_i)\) for all \(\lambda_1, \ldots, \lambda_n \in K\) i.e. if \(Ke_i\) is p-orthogonal to \(\sum_{j \neq i} Ke_j\), for each \(i\).

**Proposition 1.1** Let \(E\) be an \(n\)-dimensional space over \(K\) \((n \in \mathbb{N})\), let \(p\) be a seminorm. Then each subspace of \(E\) has a p-orthocomplement. In particular, each p-orthogonal sequence can be extended to a p-orthogonal base of \(E\).

**Proof.** The statements are well-known for norms \(p\), ([3], 5.5, 5.15). We leave the extension to the case of seminorms \(p\) to the reader.

2 The edged ease

Recall that for an absolutely convex subset \(A\) of a \(K\)-vector space, \(A^e := \bigcap_{r \in \mathbb{R}} \{\lambda a : \lambda \in K, |\lambda| \leq r, a \in A\}\) i.e., \(A^e = A\) if the valuation of \(K\) is discrete, \(A^e = \bigcap\{\lambda a : \lambda \in K, |\lambda| > 1\}\) if the valuation of \(K\) is dense. \(A\) is called edged if \(A^e = A\). The following is well-known.

**Proposition 2.1** For an absolutely convex subset \(A\) of a \(K\)-vector space the formula

\[
p_A(x) = \inf \{ |\lambda| : \lambda \in K, x \in \lambda A\}
\]

defines a seminorm \(p_A\) on \([A]\). We have

\[
\{ x \in [A] : p_A(x) < 1 \} \subset A \subset \{ x \in [A] : p_A(x) \leq 1 \}.
\]

\(A\) is edged if and only if \(A = \{ x \in [A] : p_A(x) \leq 1 \}\).

**Proposition 2.2** Let \(n \in \mathbb{N}\), let \(p, q\) be seminorms on \(K^n\). Then there exists a base \(e_1, \ldots, e_n\) of \(K^n\) that is both \(p\)- and \(q\)-orthogonal.
Proof. (After [4], 1.10). It suffices to prove the existence of an \( e \in K^n \setminus \{0\} \) and a subspace \( D \) of \( K^n \) such that \( K^n = Ke \oplus D \), and \( Ke \) and \( D \) are both \( p \)- and \( q \)-orthogonal. If \( p(e) = 0 \) for some nonzero \( e \), let \( D \) be any \( q \)-orthocomplement of \( Ke \). Then trivially \( D \) and \( Ke \) are \( p \)-orthogonal. So, we may assume that \( p \) is a norm. Let \( e_1, \ldots, e_n \) be a \( p \)-orthogonal base of \( K^n \) (see 1.1). Let \( t := \max_i q(e_i)/p(e_i) = q(e_k)/p(e_k) \) for some \( k \in \{1, \ldots, n\} \). Then \( tp(x) \geq q(x) \) for all \( x \in K^n \). Choose \( e := e_k \), let \( D \) be a \( q \)-orthocomplement of \( Ke \) (see 1.1). To show that \( Ke \) and \( D \) are also \( p \)-orthogonal let \( x \in D \). Then \( tp(e + x) \geq q(e + x) \geq q(e) = tp(e) \), so \( p(e + x) \geq p(e) \) implying orthogonality.

As a corollary we obtain

**Proposition 2.3** Let \( S \subset T \) be edged absolutely convex subsets of \( K^n \) where \( n \geq 1 \). Then there exists a base \( e_1, \ldots, e_n \) of \( K^n \), and absolutely convex \( C_1, \ldots, C_n \) and \( D_1, \ldots, D_n \) in \( K \) such that

\[
S = C_1e_1 \oplus \cdots \oplus C_ne_n \\
T = D_1e_1 \oplus \cdots \oplus D_ne_n.
\]

**Proof.** By 2.2 there is a base \( e_1, \ldots, e_m \) of \([S]\) that is both \( p_S \)- and \( p_T \)-orthogonal. Extend it to a \( p_T \)-orthogonal base \( e_1, \ldots, e_s \) of \([T]\) (see 1.1) and further extend it to a base \( e_1, \ldots, e_n \) of \( K^n \). Set

\[
C_i := \begin{cases} 
\{ \lambda \in K : p_S(\lambda e_i) \leq 1 \} & \text{if } i \in \{1, \ldots, m\} \\
\{0\} & \text{if } i \in \{m + 1, \ldots, n\}
\end{cases}
\]

\[
D_i := \begin{cases} 
\{ \lambda \in K : p_T(\lambda e_i) \leq 1 \} & \text{if } i \in \{1, \ldots, s\} \\
\{0\} & \text{if } i \in \{s + 1, \ldots, m\}.
\end{cases}
\]

To prove that \( S = \sum_{i=1}^n C_i e_i = C_1e_1 + \cdots + C_ne_n \) first observe that for each \( x \in C_1e_1 + \cdots + C_ne_n \) we have \( p_S(x) \leq 1 \), so \( x \in S \) by the last statement of 2.1 (here we use that \( S \) is edged). Hence, \( C_1e_1 + \cdots + C_ne_n \subset S \). Conversely, if \( x \in S \), \( x = \sum_{i=1}^m \lambda_i e_i \) where \( \lambda_i \in K \), then, by orthogonality and 2.1, \( 1 \geq p_S(x) = \max \{p_S(\lambda_i e_i) : i \in \{1, \ldots, m\} \} \) for each \( i \in \{1, \ldots, m\} \) i.e. \( S \subset C_1e_1 + \cdots + C_ne_n \). That \( T = \sum D_i e_i \) is proved similarly.

**Corollary 2.4** Let \( B \) be a \( B_K \)-module of finite rank. If \( B \) has the form \( T/S \), where \( S \subset T \) are edged absolutely convex sets in some finite-dimensional \( K \)-vector space then \( B \) is the direct sum of submodules of rank \( \leq 1 \).

**Proof.** Let \( e_i, C_i, D_i \) be as in 2.3. Obviously, \( C_i \subset D_i \) for each \( i \) and we find \( T/S \cong \bigoplus_{i=1}^n (D_i/C_i) \).

In the next section we will remove the edgedness condition. Notice that if the valuation of \( K \) is discrete each absolutely convex set is edged, so we may assume that the valuation of \( K \) is dense.
3 The general case

From now on in §3, let \( G := \{ |\lambda| : \lambda \in K, \lambda \neq 0 \} \). It is a multiplicative subgroup of \((0, \infty)\). The following notion has been used successfully in Functional Analysis over infinite rank valued fields to define (semi)norms, see [6], [5] for a discussion.

**Definition 3.1** A \( G \)-module is a linearly ordered set \( X \) together with an action \( G \times X \to X \) (i.e. \( g_1(g_2x) = (g_1g_2)x, 1.x = x \) for all \( g_1, g_2 \in G, x \in X \)) such that \( g_1 \geq g_2, x_1 \geq x_2 (g_1, g_2 \in G, x_1, x_2 \in X) \) implies \( g_1x_1 \geq g_2x_2 \), and such that for each \( \varepsilon \in X \) and \( x \in X \) there exists a \( g \in G \) and that \( gx < \varepsilon \).

**Lemma 3.2** Let \( X \) be a \( G \)-module, let \( x \in X \). If \( g \in G, gx = x \) then \( g = 1 \).

**Proof.** The set \( \{ g \in G : gx = x \} \) is easily seen to be a proper subgroup \( H \) of \( G \). If \( h \in H, h > 1 \) and \( g \in G, g \geq 1 \) then \( 1 \leq g \leq h^n \) for some \( n \). It follows that \( H = G \), a contradiction.

Obvious examples of \( G \)-modules are \( G \) itself, the group \((0, \infty)\) or any union of multiplicative cosets of \( G \) in \((0, \infty)\). For a more interesting example, let \( X \) be a \( G \)-module, let \( Y \) be a totally ordered set. Then \( X \times Y \) becomes a \( G \)-module under the lexicographic ordering and the action

\[
g(x, y) = (gx, y) \quad (g \in G, x \in X, y \in Y).
\]

We adjoin an element \( 0_X \) to \( X \) for which \( 0_X < x, 0_x = 0_X = 0.0 \) for every \( x \in X \) but from now on we will write \( 0 \) instead of \( 0_X \).

**Definition 3.3** Let \( E \) be a \( K \)-vector space, let \( X \) be a \( G \)-module. An \( X \)-seminorm is a map \( p : E \to X \cup \{ 0 \} \) such that \( p(0) = 0, p(\lambda x) = |\lambda|p(x), p(x+y) \leq \max(p(x), p(y)) \) for all \( \lambda \in K, x, y \in E \).

**Remark.** It is not hard to see that Proposition 1.1 remains valid if we replace \( p \) by an \( X \)-seminorm. (For a formal proof for norms, see [6], 3.3.)

To define the kind of seminorms we are interested in, let \( X := (0, \infty) \times \{ 0, 1 \} \) with the lexicographic ordering. Then for each \( r \in (0, \infty) \) the element \( (r, 1) \) is an immediate successor of \( (r, 0) \) which suggests the notation \( r \) for \( (r, 0) \) and \( r^+ \) for \( (r, 1) \). The action defined above now reads as \( |\lambda| r^+ = (|\lambda| r)^+ \) (\( \lambda \in K, \lambda \neq 0 \)). Thus, we have ‘doubled’ every positive real number \( r \) by giving it a successor \( r^+ \), and we write \( X = (0, \infty) \cup (0, \infty)^+ \) where \( (0, \infty)^+ := \{ r^+ : r \in (0, \infty) \} \).

From now on in this note we assume that the valuation of \( K \) is dense and let \( X_K := G \cup (0, \infty)^+ \) (which is a \( G \)-submodule of \((0, \infty) \times (0, \infty)^+) \) we have just introduced).

**Theorem 3.4** Let \( A \) be an absolutely convex subset of a \( K \)-vector space. Then the formula

\[
q_A(x) = \begin{cases} 
p_A(x) \text{ if } p_A(x) = \min \{|\lambda| : x \in \lambda A\} \\
p_A(x)^+ \text{ otherwise}
\end{cases}
\]
defines an $X_K$-seminorm $q_A \geq p_A$ on $[A]$ for which $A = \{ x \in [A] : q_A(x) < 1 \}$.

**Proof.** We first prove

(*) $q_A(x) \leq |\lambda| \iff x \in \lambda A$ \quad ($x \in [A], \lambda \in K, \lambda \neq 0$)

yielding the desired identity $A = \{ x \in [A] : q_A(x) < 1 \}$.

Let $q_A(x) \leq |\lambda|$. If $q_A(x) = |\mu|$ for some $\mu \in K$ then $x \in \mu A \subset \lambda A$. If $q_A(x) = r^+$ for some $r \in (0, \infty)$ then $p_A(x) \leq q_A(x) < |\lambda|$ so $p_A(\lambda^{-1} x) < 1$ hence $\lambda^{-1} x \in A$ by 2.2.

If, conversely, $x \in \lambda A$ and $q_A(x) = |\mu|$ for some $\mu \in K$ then $|\mu| = \min\{|\nu| : x \in \nu A\} \leq |\lambda|$. If $q_A(x) = r^+$ for some $r \in (0, \infty)$ then $r < |\nu|$ for all $\nu$ for which $x \in \nu A$, so $r < |\lambda|$, hence $q_A(x) = r^+ < |\lambda|$.

To show that $q_A$ is a seminorm, let $x \in [A], \lambda \in K$. If $q_A(x) = |\mu|$ for some $\mu \in K$ then $x \in \mu A$ so that $\lambda x \in \lambda \mu A$ so that by (*) $q_A(\lambda x) \leq |\lambda \mu| = |\lambda| q_A(x)$. If $q_A(x) = r^+$ for some $r \in (0, \infty)$ then $x \in \mu A$ for all $|\mu| > r$ so $\lambda x \in \nu A$ for all $|\nu| > r|\lambda|$, hence $q_A(\lambda x) \leq |\lambda|$ for all $|\nu| > r|\lambda|$ i.e. $q_A(\lambda x) \leq (r|\lambda|)^+ = |\lambda| r^+ = |\lambda| q_A(x)$. So we have proved $q_A(\lambda x) \leq |\lambda| q_A(x)$.

To prove the converse inequality (which is only needed for $\lambda \neq 0$) we observe that $|\lambda| q_A(x) = |\lambda| q_A(\lambda^{-1} \lambda x) \leq |\lambda| \lambda^{-1} q_A(\lambda x) = q_A(\lambda x)$. Finally we prove the strong triangle inequality $q_A(x+y) \leq \max(q_A(x), q_A(y))$.

**Lemma 3.5** Let $p, q$ be $X_K$-seminorms on a $K$-vector space $E$. If $\{ x \in E : p(x) < 1 \} \subset \{ x \in E : q(x) < 1 \}$ then $p \geq q$.

**Proof.** By obvious scalar multiplication we have

$\{ x \in E : p(x) \leq |\lambda| \} \subset \{ x \in E : q(x) \leq |\lambda| \}$

for each $\lambda \in K^\times$. Then the above inclusion is also true for $\lambda = 0$. Now let $r^+ \in (0, \infty)^+$. From

$\{ x \in E : p(x) \leq r^+ \} = \bigcap_{\lambda \in K, |\lambda| > r} \{ x \in E : p(x) < |\lambda| \}$

and a similar formula for $q$ we obtain

$\{ x \in E : p(x) \leq s \} \subset \{ x \in E : q(x) \leq s \}$

for every $s \in X_K \cup \{0\}$. It follows that $q \leq p$.

**Corollary 3.6** Let $E$ be a $K$-vector space, let $p$ be an $X_K$-seminorm.

(i) If $A := \{ x \in E : p(x) \leq 1 \}$ then $p = q_A$.

(ii) Let $B : E \to E$ be a linear map. If $p(x) \leq 1$ implies $p(Bx) \leq 1$ for all $x \in E$ then $p(Bx) \leq p(x)$ for all $x \in E$. 

5
Proof. (i) is a direct consequence of \( \{ x \in E : p(x) \leq 1 \} = \{ x \in E : p_A(x) \leq 1 \} \) and Lemma 3.5. For (ii) apply 3.5 to the seminorms \( p \) and \( p \circ B \).

**Proposition 3.7** Let \( n \in \mathbb{N} \), let \( p \) and \( q \) be \( X_K \)-seminorms on \( K^n \). Then there is a base of \( E \) that is both \( p \)- and \( q \)-orthogonal.

**Proof.** Like in the proof of 2.2 we prove the existence of an \( e \in K^n \setminus \{ 0 \} \) and an \((n - 1)\)-dimensional subspace \( D \) such that \( K^n = Ke \oplus D \) where \( Ke \) and \( D \) are both \( p \)- and \( q \)-orthogonal, and we may assume that \( p \) is a norm. Let \( e_1, e_2, \ldots, e_n \) be a \( p \)-orthogonal base of \( K^n \) (see Remark following 3.3). For each \( i \in \{ 1, \ldots, n \} \) let \( C_i := \{ \lambda \in K : p(\lambda e_i) \leq 1 \} \) and \( A_i := C_i e_i \). Then by \( p \)-orthogonality

\[ \{ x \in K^n : p(x) \leq 1 \} = A_1 + \cdots + A_n. \]

Now set \( l(A_i) := \{ t \in X_K \cup \{ 0 \} : \text{there is an } a \in A_i \text{ with } t \leq q(a) \} \). Then \( l(A_i) \) is an initial part of \( X_K \cup \{ 0 \} \), so \( l(A_1), \ldots, l(A_n) \) are linearly ordered by inclusion; let \( l(A_1) \) be the largest one. Set \( e := e_1 \). If \( l(A_1) = \{ 0 \} \) then \( q = 0 \) and we can take \( D = [e_2, \ldots, e_n] \), so assume \( q \neq 0 \) on \( A_1 \). Now let \( D \) be a \( q \)-orthogonal complement of \( Ke \) (Remark following 3.3) and let \( P : D + Ke \to D \) be the natural projection. We finish the proof by showing that \( Ke \) and \( D \) are \( p \)-orthogonal, i.e. that \( p(x) \leq 1 \) implies \( p(Px) \leq 1 \) (3.6 (ii)). Let \( x \in K^n, p(x) \leq 1 \). Then \( x = a_1 + \cdots + a_n \) where \( a_i \in A_i \) for each \( i \). We have, for each \( i, q(a_i) \in l(A_i) \subset l(A_1) \), so \( q(a_i) \leq q(b) \) for some \( b \in A_1 \) and \( q(b) \neq 0 \). Then \( q(Pa_i) \leq q(a_i) \leq q(b) \). Now \( Pa_i \in [b] \) so \( Pa_i = \lambda b \) for some \( \lambda \in K \). We see that \( |\lambda| q(b) \leq q(b) \) implying \( |\lambda| \leq 1 \) by 3.2, so \( Pa_i \in A_i \). Then \( Px = \sum Pa_i \in A_1 \) i.e., \( p(Px) \leq 1 \), and we are done.

**Remark.** The above proof is valid for an \( X_K \)-seminorm \( p \) and an \( X \)-seminorm \( q \) for any \( G \)-module \( X \). I do not know whether the conclusion of 3.7 holds for an \( X \)-seminorm \( p \) and a \( Y \) seminorm \( q \) where \( X \) and \( Y \) are arbitrary \( G \)-modules.

The following corollary obtains.

**Theorem 3.8** (Let \( K \) be spherically complete and) let \( B \) be a \( B_K \)-module of finite rank. Then \( B \) is a direct sum of submodules of rank \( \leq 1 \).

**Proof.** The proofs of Proposition 2.3 and Corollary 2.4 can formally be taken over, where \( p_S \) and \( p_T \) are replaced by the \( X_K \)-seminorms \( q_S \) and \( q_T \) respectively.
