A search for the narrow structure, X(5568), reported by the D0 Collaboration in the decay sequence $X \rightarrow B^0_\rho \pi^\pm$, $B^0_\rho \rightarrow J/\psi \phi$ in proton-antiproton collisions at a center-of-mass energy of $\sqrt{s} = 1.96$ TeV at the Tevatron collider [1]. The structure was interpreted as a tetraquark with four different quark flavors: $b, s, u,$ and $d$. The mass and natural width of this state were fitted to be $m = 5567.8 \pm 2.9\text{(stat)}^{\pm 0.9}_{-1.9}\text{(syst)}$ MeV and $\Gamma = 21.9 \pm 6.4\text{(stat)}^{\pm 1.0}_{-2.5}\text{(syst)}$ MeV, respectively, and the signal significance is 5.1σ. The ratio $\rho_X$ of the yield of $X(5568)$ to the yield of the $B^0_\rho$ meson for a transverse momentum range $10 < p_T(B^0_\rho) < 30$ GeV was measured to be $0.086 \pm 0.019\text{(stat)} \pm 0.014\text{(syst)}$. The result initiated a discussion of the nature of the new state and prospects for observation of other tetraquark hadrons [2–6]. Recently, the D0 Collaboration reported further evidence for the resonance $X(5568)$ [7] in the decay sequence $X \rightarrow B^0_\rho \pi^\pm, B^0_\rho \rightarrow \mu^+\nu D^0_{s\pm}, D^0_{s\pm} \rightarrow \phi\pi^\pm$, which is consistent with their previous measurement [1]. However, searches for $X(5568)$ in decays to $B^0_\rho \pi^\pm, B^0_\rho \rightarrow J/\psi\phi$ performed by the LHCb [8] and CMS [9] Collaborations in proton-proton ($pp$) collisions at the LHC and by the CDF Collaboration [10] at the Tevatron, revealed no signal. The upper limits $\rho_X < 0.024$ [LHCb, $p_T(B^0_\rho) > 10$ GeV], $\rho_X < 0.011$ [CMS, $p_T(B^0_\rho) > 10$ GeV] and $\rho_X < 0.010$ [CMS, $p_T(B^0_\rho) > 15$ GeV] at 95% confidence level (C.L.) were determined within the acceptances of the LHCb and CMS experiments. CDF set an upper limit $\rho_X < 0.067$ at 95% C.L. within a kinematic range similar to that of D0 [1].

In this Letter, a search for the $X(5568)$ state by the ATLAS experiment at the LHC is presented ($B^0_\rho$ refers to both the $B^0$, and $\bar{B}^0$ mesons). The $B^0_\rho$ mesons are reconstructed in their decays to $J/\psi(\mu^+\mu^-)\phi(K^+K^-)$. The analysis is based on a combined sample of $pp$ collision data at $\sqrt{s} = 7$ and 8 TeV corresponding to integrated luminosities of 4.9 and 19.5 fb$^{-1}$, respectively. The ATLAS detector [11] covers nearly the entire solid angle around the collision point with layers of tracking detectors, calorimeters, and muon chambers. The muon and tracking systems are of particular importance in the reconstruction of $B$ mesons. The inner tracking detector (ID) consists of a silicon pixel detector, a silicon microstrip detector and a transition radiation tracker. The muon spectrometer (MS) surrounds the calorimeters and consists of three large superconducting toroids with eight coils each, a system of tracking chambers, and detectors for triggering. To study the detector response, to estimate backgrounds, and to model systematic effects, $12 \times 10^6$ Monte Carlo (MC) simulated $B^0_\rho \rightarrow J/\psi\phi$ and $1 \times 10^6 B^0_\rho \pi^\pm$ events were generated using Pythia 8.183 [12,13] tuned with ATLAS data [14]. Multiple overlaid proton-proton collisions (pileup) were simulated with Pythia soft QCD processes. The detector response was simulated using the ATLAS simulation framework [15] based on Geant4 [16]. The MC events were weighted to reproduce the same pileup and trigger conditions as in the data. As in the D0 analysis [1], the $B^0_\rho \pi^\pm$ resonance was generated using the Breit-Wigner (BW) parametrization appropriate for an S-wave two-body decay near threshold:

The D0 Collaboration reported evidence of a narrow structure, $X(5568)$, in the decay $X \rightarrow B^0_\rho \pi^\pm$ with $B^0_\rho \rightarrow J/\psi\phi$ in proton-antiproton collisions at a center-of-mass energy of $\sqrt{s} = 1.96$ TeV at the Tevatron collider [1]. The ratio $\rho_X$ of the yield of $X(5568)$ to the yield of the $B^0_\rho$ meson for a transverse momentum range $10 < p_T(B^0_\rho) < 30$ GeV was measured to be $0.086 \pm 0.019\text{(stat)} \pm 0.014\text{(syst)}$. The result initiated a discussion of the nature of the new state and prospects for observation of other tetraquark hadrons [2–6]. Recently, the D0 Collaboration reported further evidence for the resonance $X(5568)$ [7] in the decay sequence $X \rightarrow B^0_\rho \pi^\pm, B^0_\rho \rightarrow \mu^+\nu D^0_{s\pm}, D^0_{s\pm} \rightarrow \phi\pi^\pm$, which is consistent with their previous measurement [1]. However, searches for $X(5568)$ in decays to $B^0_\rho \pi^\pm, B^0_\rho \rightarrow J/\psi\phi$ performed by the LHCb [8] and CMS [9] Collaborations in proton-proton ($pp$) collisions at the LHC and by the CDF Collaboration [10] at the Tevatron, revealed no signal. The upper limits $\rho_X < 0.024$ [LHCb, $p_T(B^0_\rho) > 10$ GeV], $\rho_X < 0.011$ [CMS, $p_T(B^0_\rho) > 10$ GeV] and $\rho_X < 0.010$ [CMS, $p_T(B^0_\rho) > 15$ GeV] at 95% confidence level (C.L.) were determined within the acceptances of the LHCb and CMS experiments. CDF set an upper limit $\rho_X < 0.067$ at 95% C.L. within a kinematic range similar to that of D0 [1].

In this Letter, a search for the $X(5568)$ state by the ATLAS experiment at the LHC is presented ($B^0_\rho$ refers to both the $B^0$, and $\bar{B}^0$ mesons). The $B^0_\rho$ mesons are reconstructed in their decays to $J/\psi(\mu^+\mu^-)\phi(K^+K^-)$. The analysis is based on a combined sample of $pp$ collision data at $\sqrt{s} = 7$ and 8 TeV corresponding to integrated luminosities of 4.9 and 19.5 fb$^{-1}$, respectively. The ATLAS detector [11] covers nearly the entire solid angle around the collision point with layers of tracking detectors, calorimeters, and muon chambers. The muon and tracking systems are of particular importance in the reconstruction of $B$ mesons. The inner tracking detector (ID) consists of a silicon pixel detector, a silicon microstrip detector and a transition radiation tracker. The muon spectrometer (MS) surrounds the calorimeters and consists of three large superconducting toroids with eight coils each, a system of tracking chambers, and detectors for triggering. To study the detector response, to estimate backgrounds, and to model systematic effects, $12 \times 10^6$ Monte Carlo (MC) simulated $B^0_\rho \rightarrow J/\psi\phi$ and $1 \times 10^6 B^0_\rho \pi^\pm$ events were generated using Pythia 8.183 [12,13] tuned with ATLAS data [14]. Multiple overlaid proton-proton collisions (pileup) were simulated with Pythia soft QCD processes. The detector response was simulated using the ATLAS simulation framework [15] based on Geant4 [16]. The MC events were weighted to reproduce the same pileup and trigger conditions as in the data. As in the D0 analysis [1], the $B^0_\rho \pi^\pm$ resonance was generated using the Breit-Wigner (BW) parametrization appropriate for an S-wave two-body decay near threshold:
where $m(B^0_s\pi^\pm)$ is the invariant mass of the $B_s^0\pi^\pm$ candidate and $m_X$ and $\Gamma_X$ are the mass and the natural width of the resonance. The mass-dependent width is

$$\Gamma(m(B^0_s\pi^\pm), \Gamma_X) = \Gamma(1 - m^2(B^0_s\pi^\pm)/m_X^2) + \Gamma(1 - m^2(B^0_s\pi^\pm)/\Gamma_X^2),$$

(1)

and the width was set to $m_X = 5567.8$ MeV and $\Gamma_X = 21.9$ MeV, as reported in Ref. [1]. The events were selected by the dimuon triggers [17] based on identification of a $J/\psi \to \mu^+\mu^-$ decay, with $p_T$ thresholds of either 4 or 6 GeV, with both symmetric, (4, 4) or (6, 6) GeV, and asymmetric, (4, 6) GeV, combinations. In addition, each event must contain at least one reconstructed primary vertex (PV), formed from at least six ID tracks. The selection of $J/\psi$ and $\phi \to K^+K^-$ candidates is identical to the one described in detail in Ref. [18]. Candidates for $B_s^0 \to J/\psi \phi$ decays are selected by fitting the tracks for each combination of $J/\psi \to \mu^+\mu^-$ and $\phi \to K^+K^-$ to a common vertex. The fit is further constrained by fixing the invariant mass of the two muon tracks to the $J/\psi$ mass [19]. A quadruplet of tracks is accepted for further analysis if the vertex fit has a $\chi^2$/d.o.f. $< 3$. For each $B_s^0$ meson candidate the proper decay time $t$ is extracted using the method described in Ref. [18]. Events with $t > 0.2$ ps are selected to reduce the background from the events with a $J/\psi$ produced directly in the $pp$ collision. If there is more than one accepted $B_s^0$ candidate in the event, the candidate with the lowest $\chi^2$/d.o.f. of the vertex fit is selected. For the selected events the average number of proton-proton interactions per bunch crossing is 21, necessitating a choice of the best candidate for the PV at which the $B_s^0$ meson is produced. The variable used is the three-dimensional impact parameter $d_0$, which is calculated as the distance between the line extrapolated from the reconstructed $B_s^0$ meson vertex in the direction of the $B_s^0$ momentum, and each PV candidate. The chosen PV is the one with the smallest $d_0$. Using MC simulation it was shown that the fraction of $B^0_s$ candidates that are assigned the wrong PV is less than 1% [18] and that the corresponding effect on the results is negligible. Finally, a requirement that the $B_s^0$ transverse momentum is greater than 10 GeV is applied. Figure 1 shows the reconstructed $J/\psi K^+K^-$ mass distribution and the result of an extended unbinned maximum-likelihood fit in the range (5150–5650) MeV, in which the signal is modeled by a sum of two Gaussian distributions and an exponential function is used to model the combinatorial background. The observed signal width is consistent with MC simulation. The fitted $B_s^0$ mass is $m_{\text{fit}}(B_s^0) = 5366.6 \pm 0.1$ (stat) MeV, in agreement with the world average value 5366.89 $\pm$ 0.19 MeV [19]. For further investigation, only candidates with a reconstructed mass in the signal region 5346.6–5386.6 MeV are included, which gives $N(B_s^0) = 52750 \pm 280$ (stat) candidates.

The $B_s^0\pi^\pm$ candidates are constructed by combining each of the tracks forming the selected PV with the selected $B_s^0$ candidate. Tracks that were already used to reconstruct the $B_s^0$ candidate and tracks identified as leptons ($e$ or $\mu$) are excluded, as well as tracks with transverse momentum $p_T < 500$ MeV. This $p_T$ selection was chosen to maximize the ratio of the $B_s^0\pi^\pm$ signal to the background, based on MC simulation. Assigning the pion mass hypothesis to the tracks that pass these selection criteria, the mass $m(B_s^0\pi^\pm)$ is calculated as $m(J/\psi K^+K^-) - m(J/\psi K^-) + m_{\text{fit}}(B_s^0)$, where $m_{\text{fit}}(B_s^0) = 5366.6$ MeV. On average there are 1.8 $B_s^0\pi^\pm$ candidates in each selected event and all are retained for the analysis. A systematic study has shown that the effect on the results due to multiple candidates is negligible. The mass distribution of $B_s^0\pi^\pm$ candidates is fitted using an extended unbinned maximum-likelihood method. The probability density function (PDF) for the background component is defined as a threshold function:

$$F_{\text{bck}}(m(B_s^0\pi^\pm)) = \left(\frac{m(B_s^0\pi^\pm) - m_{\text{thr}}}{n}\right)^a \times \exp\left(\sum_{i=1}^{4} p_i \left(\frac{m(B_s^0\pi^\pm) - m_{\text{thr}}}{n}\right)^i\right),$$

(2)

where $m_{\text{thr}} = m_{\text{fit}}(B_s^0) + m_x$ and $n$, $a$, and $p_i$ are free parameters of the fit. The background PDF was tested using...
events with no real $B_s^0\pi^\pm$ candidates from two categories. The first background sample contains data events where $B_s^0\pi^\pm$ candidates are formed using “fake” $B_s^0$ mesons from the mass sidebands, shown in Fig. 1 by red shaded bands, defined as $5150 < m(J/\psi K^+ K^-) < 5210$ MeV and $5510 < m(J/\psi K^+ K^-) < 5650$ MeV. The second background sample is modeled using MC events containing only $B_s^0$ mesons not originating from the $B_s^0\pi^\pm$ signal, tuned to reproduce the $B_s^0$ transverse momentum distribution in data. In these events the $B_s^0$ meson is combined with each of the tracks originating from the selected PV. The first sample is normalized to the fitted number of $B_s^0$ background events in the $B_s^0$ mass signal region 5346.6–5386.6 MeV, while the second sample is normalized to the fitted number of $B_s^0$ signal events in the same region. The sum of these two distributions is consistent with the distribution of the data. The function in Eq. (2) describes both background distributions as well as their sum within uncertainties. The signal PDF $f_{\text{sig}}(m(B_s^0\pi^\pm))$ is defined as a convolution of an $S$-wave Breit-Wigner PDF, defined in Eq. (1), and the detector resolution represented by a Gaussian function with a width that is calculated individually for each $B_s^0\pi^\pm$ candidate from the tracking and vertexing error matrices. Using MC and data samples, it has been verified that the per candidate mass resolutions are the same for the $B_s^0\pi^\pm$ signal and for the background events passing the selection criteria. The average resolution for the $B_s^0\pi^\pm$ signal, with the mass and width corresponding to those of the structure reported by the D0 Collaboration ($m_X = 5567.8$ MeV and $\Gamma_X = 21.9$ MeV), is 3.2 MeV. The full probability function used is

$$F(m(B_s^0\pi^\pm)) = N(X)F_{\text{sig}}(m(B_s^0\pi^\pm)) + [N_{\text{can}} - N(X)]F_{\text{bck}}(m(B_s^0\pi^\pm)),\quad (3)$$

where $N(X)$ is the number of signal events and $N_{\text{can}}$ is the number of all selected $B_s^0\pi^\pm$ candidates. The signal mass and width are fixed to the central values reported by the D0 Collaboration. Following other experiments, fits are performed for two subsets of $B_s^0\pi^\pm$ candidates, first with $p_T(B_s^0) > 10$ GeV and second with $p_T(B_s^0) > 15$ GeV. The results of the fits are shown in Fig. 2 and summarized in Table I. No significant $X(5568)$ signal is observed. Additional selections such as cuts on the angle between the momenta of the $B_s^0$ and $\pi^\pm$ candidates were investigated and did not produce evidence of a signal. These were found to introduce peaking background so are not included in the analysis. The yields $N(X)$ and $N(B_s^0)$ obtained from the fits are used to evaluate the $X$ production rate relative to $B_s^0$, within the ATLAS acceptance, using the formula

$$\rho_X = \frac{\sigma(pp \rightarrow X + \text{anything}) \times B(X \rightarrow B_s^0\pi^\pm)}{\sigma(pp \rightarrow B_s^0) \times e_{\text{rel}}(X)},\quad (4)$$

where $\sigma$ represents the production cross section for each of the particles, within the ATLAS acceptance, and the relative efficiency $e_{\text{rel}}(X) = e(X)/e(B_s^0)$ is the selection efficiency for the state $X$, decaying to $B_s^0\pi^\pm$, relative to that for the $B_s^0$ meson and accounts for the reconstruction and selection

![Graph](image)

**TABLE I.** Yields of $B_s^0$ and $X(5568)$ candidates obtained from the fits to the $B_s^0$ and $B_s^0\pi^\pm$ candidate mass distributions, with statistical uncertainties. The values given for $N(B_s^0)$ are those inside the $B_s^0$ signal window. The reported values for $X(5568)$ are obtained from the fits with signal mass and width parameters fixed to those reported by the D0 Collaboration. The relative efficiencies $e_{\text{rel}}(X)$ and their uncertainties are described in the text.

efficiency of the companion pion, including the soft pion acceptance.

The relative efficiency, \( e_{\text{rel}}(X) \), was determined using MC simulation of events containing \( X \to B_s^0 \pi^\pm \) and \( B_s^0 \) decays. In the ratio, the acceptance of the \( B_s^0 \) decay cancels, so the value to be determined is the pion reconstruction efficiency for \( B_s^0 \pi^\pm \) events in which the \( B_s^0 \) meson satisfies acceptance, reconstruction, and selection criteria. Based on MC events, \( e_{\text{rel}}(X) \) is determined as a function of \( p_T(B_s^0) \) and of \( m(B_s^0\pi^\pm) \). Using an MC-based function, the acceptance is determined individually for each \( B_s^0\pi^\pm \) candidate, based on its measured values of \( p_T(B_s^0) \) and \( m(B_s^0\pi^\pm) \). The acceptance ratio, \( e_{\text{rel}}(X) \), is calculated as an average over the events included in the \( m(B_s^0\pi^\pm) \) interval within which the search for a resonance is performed. The width of this interval is defined by a BW function convolved with the mass resolution function, with the start and end points of the range chosen to include 99% of the signal events. The uncertainty of \( e_{\text{rel}}(X) \) is calculated by varying the fitted parameters of the MC-based function used to describe the acceptance as a function of \( p_T(B_s^0) \) within their uncertainties. Small variations of this function due to the pseudorapidity of the \( B_s^0 \) were investigated and are included in the systematic uncertainties. The error also includes the uncertainty in the number of data events used in the average and the statistical uncertainty in the \( p_T(B_s^0) \) distribution of these events. The error in the pion reconstruction efficiency, arising from uncertainties in the amount of ID material, is found to have a negligible effect on \( \rho_X \).

As no significant signal is observed, corresponding to the properties of the \( X(5568) \) as reported by Ref. [1], upper limits are determined for the number of \( B_s^0\pi^\pm \) signal events, \( N(X) \), and for the relative production rate, \( \rho_X \). These are calculated using the asymptotic approximation from the profile likelihood formalism [20] based on the CL_{syst} frequentist method [21]. To establish the limit on the number of \( B_s^0\pi^\pm \) signal events, the PDF models for signal and background, defined respectively by Eqs. (1) and (2), are used as inputs to the CL_{syst} method. Without systematic uncertainties, the extracted upper limits at 95% C.L. are \( N(X) < 264 \) for \( p_T(B_s^0) > 10 \text{ GeV} \) and \( N(X) < 213 \) for \( p_T(B_s^0) > 15 \text{ GeV} \). Systematic uncertainties affecting these limits are included in the determination of \( N(X) \). To obtain results that can be compared to the state \( X(5568) \) reported by the D0 Collaboration, systematic uncertainties are assigned by varying the values of \( m_X \) and \( \Gamma_X \) independently within Gaussian constraints, with uncertainties equal to those quoted in Ref. [1]. The default model of the \( X \) resonance, which is assumed to be spinless, is changed to a BW P-wave resonance. To include the systematic uncertainty due to the modeling of the background, the default PDF of Eq. (2) is replaced by a seventh-order Chebyshev polynomial, allowing more free parameters in the fit. For the detector resolution, the default per-candidate mass resolution model is replaced by the sum of three Gaussian functions with a common mean. The parameters used are determined from the \( B_s^0\pi^\pm \) MC sample. Using these alternative models, upper limits that include systematic uncertainties are extracted, leading to values \( N(X) < 382 \) for \( p_T(B_s^0) > 10 \text{ GeV} \) and \( N(X) < 356 \) for \( p_T(B_s^0) > 15 \text{ GeV} \). To extract the upper limits on \( \rho_X \) additional systematic uncertainties are included. The calculation of \( \rho_X \) also depends on the precision of extracting the number of \( B_s^0 \) signal events and the relative efficiency \( e_{\text{rel}}(X) \). To include these uncertainties, the central values and the uncertainties of the number of \( B_s^0 \) signal events and \( e_{\text{rel}}(X) \) are used to construct Gaussian constraints, which are included as additional inputs to the CL_{syst} method. Both the statistical and systematic uncertainties are included after being summed in quadrature. For the \( B_s^0 \) signal, the default fit model of two Gaussian functions is changed to a triple Gaussian function and the change in the result is taken as a systematic uncertainty. The uncertainty due to the proper decay time requirement \( |t| > 0.2 \text{ ps} \) was estimated by varying it within the time resolution and found to be negligible. The resulting upper limits at 95% C.L. are \( \rho_X < 0.015 \) for \( p_T(B_s^0) > 10 \text{ GeV} \) and \( \rho_X < 0.016 \) for \( p_T(B_s^0) > 15 \text{ GeV} \). A hypothesis test is performed for the presence of a \( B_s^0\pi^\pm \) peak for every 5 MeV step in its mass from 5550 to 5700 MeV, assuming a resonant state as described by Eq. (1), with a BW width of 21.9 MeV [1] and \( p_T(B_s^0) > 10 \text{ GeV} \). For each \( B_s^0\pi^\pm \) mass tested, \( e_{\text{rel}}(X) \) is calculated using the same method as for \( X(5568) \). The values of \( e_{\text{rel}}(X) \) vary from 0.50 to 0.55 in the search interval. The upper limit of \( \rho_X \) at 95% C.L. is determined for each tested
mass. The same systematic uncertainties as in the determination of $\rho_X$ for the state $X(5568)$ are included, with the exception of the $X(5568)$ mass uncertainty. The median expected upper limit at 95% C.L. as a function of the $B^0\pi^\pm$ mass is also determined with $\pm\sigma$ and $\pm2\sigma$ error bands. The results are shown in Fig. 3.

In conclusion, a search for a new state $X(5568)$ decaying to $B^0\pi^\pm$, with properties as reported by the D0 Collaboration, was performed by the ATLAS experiment at the LHC, using $4.9$ fb$^{-1}$ of $pp$ collision data at 7 TeV and 19.5 fb$^{-1}$ at 8 TeV. No significant signal was found. Within the acceptance in which this analysis is performed, upper limits on the number of signal events, $N(X)$, and on the $X$ production rate relative to $B^0$ mesons, were determined at 95% C.L., resulting in $N(X) < 382$ and $\rho_X < 0.015$ for $p_T(B^0) > 10$ GeV, and $N(X) < 356$ and $\rho_X < 0.016$ for $p_T(B^0) > 15$ GeV. Limits are also set for potential $B^0\pi^\pm$ resonances in the mass range from 5550 to 5700 MeV. Across the full range, the upper limit set on $\rho_X$ at 95% C.L. varies between 0.010 and 0.018, and does not exceed the $\pm1\sigma$ error band from the expected limit.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently. We acknowledge the support of ANPCyT, Argentina; YerPhi, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; SSTC, Belarus; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; CONICYT, Chile; CAS, MOST and NSFC, China; COLCIENCIAS, Colombia; MSMT CR, MPO CR and VSC CR, Czech Republic; DLR and Knox Center, Germany; INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), ASGC (Taiwan), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [22].

19 School of Physics and Astronomy, University of Birmingham, Birmingham, United Kingdom
20a Department of Physics, Bogazici University, Istanbul, Turkey
20b Department of Physics Engineering, Gaziantep University, Gaziantep, Turkey
20c Istanbul Bilgi University, Faculty of Engineering and Natural Sciences, Istanbul, Turkey
20d Bahcesehir University, Faculty of Engineering and Natural Sciences, Istanbul, Turkey
21 Centro de Investigaciones, Universidad Antonio Narino, Bogota, Colombia
22a INFN Sezione di Bologna, Italy
22b Dipartimento di Fisica e Astronomia, Università di Bologna, Bologna, Italy
23 Physikalisches Institut, University of Bonn, Bonn, Germany
24 Department of Physics, Boston University, Boston, Massachusetts, USA
25 Department of Physics, Brandeis University, Waltham, Massachusetts, USA
26a Universidade Federal do Rio De Janeiro COPPE/EE/IF, Rio de Janeiro, Brazil
26b Electrical Circuits Department, Federal University of Juiz de Fora (UFJF), Juiz de Fora, Brazil
26c Federal University of Sao Joao del Rei (UFSJ), Sao Joao del Rei, Brazil
26d Instituto de Fisica, Universidade de Sao Paulo, Sao Paulo, Brazil
27 Physics Department, Brookhaven National Laboratory, Upton, New York, USA
28a Transilvania University of Brasov, Brasov, Romania
28b Horia Hulubei National Institute of Physics and Nuclear Engineering, Bucharest, Romania
28c Department of Physics, Alexandru Ioan Cuza University of Iasi, Iasi, Romania
28d National Institute for Research and Development of Isotopic and Molecular Technologies, Physics Department, Cluj Napoca, Romania
28e University Politehnica Bucharest, Bucharest, Romania
28f West University in Timisoara, Timisoara, Romania
29 Departamento de Física, Universidad de Buenos Aires, Buenos Aires, Argentina
30 Cavendish Laboratory, University of Cambridge, Cambridge, United Kingdom
31 Department of Physics, Carleton University, Ottawa, Ontario, Canada
32 CERN, Geneva, Switzerland
33 Enrico Fermi Institute, University of Chicago, Chicago, Illinois, USA
34a Departamento de Física, Pontificia Universidad Católica de Chile, Santiago, Chile
34b Departamento de Física, Universidad Técnica Federico Santa Maria, Valparaiso, Chile
35 Institute of High Energy Physics, Chinese Academy of Sciences, Beijing, China

202007-14
35b Department of Physics, Nanjing University, Jiangsu, China
35c Physics Department, Tsinghua University, Beijing 100084, China
35d University of Chinese Academy of Science (UCAS), Beijing, China
36a School of Physics, Shandong University, Shandong, China
36b School of Physics and Astronomy, Key Laboratory for Particle Physics, Astrophysics and Cosmology, Ministry of Education; Shanghai Key Laboratory for Particle Physics and Cosmology, Shanghai Jiao Tong University, China
36c Department of Modern Physics and State Key Laboratory of Particle Detection and Electronics, University of Science and Technology of China, Anhui, China
37 Université Clermont Auvergne, CNRS/IN2P3, LPC, Clermont-Ferrand, France
38 Nevis Laboratory, Columbia University, Irvington, New York, USA
39 Niels Bohr Institute, University of Copenhagen, København, Denmark
40a INFN Gruppo Collegato di Cosenza, Laboratori Nazionali di Frascati, Italy
40b Dipartimento di Fisica, Università della Calabria, Rende, Italy
41a AGH University of Science and Technology, Faculty of Physics and Applied Computer Science, Krakow, Poland
41b Marian Smoluchowski Institute of Physics, Jagiellonian University, Krakow, Poland
42 Institute of Nuclear Physics Polish Academy of Sciences, Krakow, Poland
43 Physics Department, Southern Methodist University, Dallas, Texas, USA
44 Physics Department, University of Texas at Dallas, Richardson, Texas, USA
45 DESY, Hamburg and Zeuthen, Germany
46 Lehrstuhl für Experimentelle Physik IV, Technische Universität Dortmund, Dortmund, Germany
47 Institut für Kern- und Teilchenphysik, Technische Universität Dresden, Dresden, Germany
48 Department of Physics, Duke University, Durham, North Carolina, USA
49 SUPA - School of Physics and Astronomy, University of Edinburgh, Edinburgh, United Kingdom
50 INFN e Laboratori Nazionali di Frascati, Frascati, Italy
51 Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg, Germany
52 Département de Physique Nucléaire et Corpusculaire, Université de Genève, Geneva, Switzerland
53 INFN Sezione di Genova, Italy
53b Dipartimento di Fisica, Università di Genova, Genova, Italy
54a E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi, Georgia
54b High Energy Physics Institute, Tbilisi State University, Tbilisi, Georgia
55 Il Physikalisches Institut, Justus-Liebig-Universität Giessen, Giessen, Germany
56 SUPA - School of Physics and Astronomy, University of Glasgow, Glasgow, United Kingdom
57 Laboratoire de Physique Subatomique et de Cosmologie, Université Grenoble-Alpes, CNRS/IN2P3, Grenoble, France
58 Il Physikalisches Institut, Georg-August-Universität, Göttingen, Germany
59 Laboratory for Particle Physics and Cosmology, Harvard University, Cambridge, Massachusetts, USA
60a Kirchhoff-Institut für Physik, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
60b Physikalisches Institut, Ruprecht-Karls-Universität Heidelberg, Heidelberg, Germany
61 Faculty of Applied Information Science, Hiroshima Institute of Technology, Hiroshima, Japan
62 Department of Physics, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, China
63 Department of Physics, The University of Hong Kong, Hong Kong, China
64 Department of Physics and Institute for Advanced Study, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China
65 Department of Physics, National Tsing Hua University, Hsinchu, Taiwan
66 Department of Physics, Indiana University, Bloomington, Indiana, USA
67 Department of Physics and Astronomy, Iowa State University, Ames, Iowa, USA
68 Joint Institute for Nuclear Research, JINR Dubna, Dubna, Russia
69 KEK, High Energy Accelerator Research Organization, Tsukuba, Japan
70 Graduate School of Science, Kobe University, Kobe, Japan
71 Faculty of Science, Kyoto University, Kyoto, Japan
72 Kyoto University of Education, Kyoto, Japan
73 Research Center for Advanced Particle Physics and Department of Physics, Kyushu University, Fukuoka, Japan
74 Instituto de Física La Plata, Universidad Nacional de La Plata and CONICET, La Plata, Argentina
75 Physics Department, Lancaster University, Lancaster, United Kingdom
76 INFN Sezione di Lecce, Italy
77 Dipartimento di Matematica e Fisica, Università del Salento, Lecce, Italy
78 Department of Experimental Particle Physics, Jožef Stefan Institute and Department of Physics, University of Ljubljana, Ljubljana, Slovenia
Department of Physics, University of British Columbia, Vancouver, British Columbia, Canada
Department of Physics and Astronomy, University of Victoria, Victoria, British Columbia, Canada
Department of Physics, University of Warwick, Coventry, United Kingdom
Waseda University, Tokyo, Japan
Department of Particle Physics, The Weizmann Institute of Science, Rehovot, Israel
Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal, Germany
Fakultät für Physik und Astronomie, Julius-Maximilians-Universität, Würzburg, Germany
Department of Physics, Yale University, New Haven, Connecticut, USA
Yerevan Physics Institute, Yerevan, Armenia
Centre de Calcul de l’Institut National de Physique Nucléaire et de Physique des Particules (IN2P3), Villeurbanne, France
Academia Sinica Grid Computing, Institute of Physics, Academia Sinica, Taipei, Taiwan

Department of Physics, King’s College London, London, United Kingdom.
Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
Also at Novosibirsk State University, Novosibirsk, Russia.
Also at TRIUMF, Vancouver, British Columbia, Canada.
Also at Department of Physics & Astronomy, University of Louisville, Louisville, KY, USA.
Also at University of Wisconsin, Madison, Wisconsin, USA.
Also at Wuppertal University, Bergische Universität Wuppertal, Wuppertal, Germany.
Also at University of Wisconsin, Madison, Wisconsin, USA.
Also at Department of Physics, University of Virginia, Charlottesville, Virginia, USA.
Also at Department of Physics, University of Wisconsin, Madison, Wisconsin, USA.
Also at Department of Physics, University of Wisconsin, Madison, Wisconsin, USA.

Deceased.
Also at Department of Physics, King’s College London, London, United Kingdom.
Also at Institute of Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen, Nijmegen, Netherlands.
Also at Department of Physics, The University of Texas at Austin, Austin, TX, USA.
Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku, Azerbaijan.
Also at Novosibirsk State University, Novosibirsk, Russia.
Also at TRIUMF, Vancouver, British Columbia, Canada.
Also at Department of Physics & Astronomy, University of Louisville, Louisville, KY, USA.
Also at Physics Department, An-Najah National University, Nablus, Palestine.
Also at Department of Physics, California State University, Fresno, CA, USA.
Also at Department of Physics, University of Fribourg, Fribourg, Switzerland.
Also at York University, Fribourg, Switzerland.
Also at Department de Física de la Universitat Autònoma de Barcelona, Barcelona, Spain.
Also at Tomsk State University, Tomsk, and Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia.
Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing, China.
Also at Universita di Napoli Parthenope, Napoli, Italy.
Also at Institute of Particle Physics (IPP), Canada.
Also at Horia Hulubei National Institute of Physics and Nuclear Engineering, Bucharest, Romania.
Also at CPPM, Aix-Marseille Université and CNRS/IN2P3, Marseille, France.
Also at Department of Physics, St. Petersburg State Polytechnical University, St. Petersburg, Russia.
Also at Borough of Manhattan Community College, City University of New York, New York City, NY, USA.
Also at Department of Financial and Management Engineering, University of the Aegean, Chios, Greece.
Also at Centre for High Performance Computing, CSIR Campus, Rosebank, Cape Town, South Africa.
Also at Louisiana Tech University, Ruston, LA, USA.
Also at Instituto Catalana de Recerca i Estudis Avancats, ICREA, Barcelona, Spain.
Also at Department of Physics, The University of Michigan, Ann Arbor, MI, USA.
Also at LAL, Univ. Paris-Sud, CNRS/IN2P3, Université Paris-Saclay, Orsay, France.
Also at Graduate School of Science, Osaka University, Osaka, Japan.
Also at Fakultät für Mathematik und Physik, Albert-Ludwigs-Universität, Freiburg, Germany.
Also at Institute for Mathematics, Astrophysics and Particle Physics, Radboud University Nijmegen/Nikhef, Nijmegen, Netherlands.
Also at Department of Physics, The University of Texas at Austin, Austin, TX, USA.
Also at Institute of Theoretical Physics, Ilia State University, Tbilisi, Georgia.
Also at CERN, Geneva, Switzerland.
Also at Georgian Technical University (GTU), Tbilisi, Georgia.
Also at Ochadai Academic Production, Ochanomizu University, Tokyo, Japan.
Also at Manhattan College, New York, NY, USA.
Also at The City College of New York, New York, NY, USA.
Also at Departmento de Física Teórica y del Cosmos, Universidad de Granada, Granada, Portugal.
Also at Department of Physics, California State University, Sacramento, CA, USA.
Also at Moscow Institute of Physics and Technology State University, Dolgoprudny, Russia.
Also at Departement de Physique Nucleaire et Corpusculaire, Université de Genève, Geneva, Switzerland.
Also at Departement de Physique Nucleaire et Corpusculaire, Université de Genève, Geneva, Switzerland.
Also at Institute of Physics, Bulgarian Academy of Sciences, Sofia, Bulgaria.
Also at Faculty of Physics, M. V. Lomonosov Moscow State University, Moscow, Russia.
Also at National Research Nuclear University MEPhI, Moscow, Russia.
Also at Department of Physics, Stanford University, Stanford, CA, USA.
Also at Institute for Particle and Nuclear Physics, Wigner Research Centre for Physics, Budapest, Hungary.
Also at Giresun University, Faculty of Engineering, Turkey.
vv Also at Department of Physics, Nanjing University, Jiangsu, China.
ww Also at Institute of Physics, Academia Sinica, Taipei, Taiwan.
xx Also at University of Malaya, Department of Physics, Kuala Lumpur, Malaysia.
